IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1002131

Visual Inspection

Miscellaneous concrete and bearing repairs were made to the abutments and piers in 2002 under contract D259214. Deck joints were also replaced under this contract.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically had minor rust scale. Bearings 1, 7, and 8 on the North Abutment had heavy rust scale.

Substructure

South Abutment – Concrete abutment, backwall, and pedestals contained minor isolated areas of delaminated concrete and cracking. There was minor rust and water staining on the back wall. Pedestal 5 contained delaminated concrete on the top North West face. The remaining pedestal and stem concrete did not appear to be delaminated. The steel deck pan exhibited rust on the East side of all of the girders.

Pier 1 – The North and South faces of the concrete cap beam and the columns contained areas of delaminated concrete and cracking. The pedestal and stem concrete did not appear to be delaminated. Column 1 had several cracks from top to bottom around the entire perimeter. Columns 3 and 4 contained areas of delaminated concrete.

Pier 2 – The North and South faces of the concrete cap beam and the columns contained areas of delaminated concrete and cracking. The pedestal

concrete did not appear to be delaminated. Columns 3 and 4 contained areas of delaminated concrete.

North Abutment – Concrete abutment, backwall, and pedestals contained minor isolated areas of delaminated concrete and cracking. There is minor rust and water staining on the back wall. The pedestal and stem concrete do not appear to be delaminated. 2" rigid insulation was used for joint filler on the bottom side of the deck.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1002131

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

100% hands on inspection of cover plates performed – no cracks found.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed. The deck pan is starting to show rust on the South Abutment end.

Paint

Paint had started to fail along edges of girders and webs of fascia girders.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 South Bound Bridge over Route 5. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-00213-1 Interstate Route 481 South Bound over Route 5

Type of Material	Estimated Amount
Sheet Packing	11.1 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 South Bound Bridge over Route 5 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-00213-1 Interstate Route 481 South Bound over Route 5

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slabs at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 11.1 square meters. This estimate is based on field measurements taken at the time of the site visit. The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E
NYSPE 084915

DATE: FEBRUARY 10, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1002131 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1002131 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E.**
NYSPE 084915

DATE: **MAY 21, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1002131 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Interior Girders, End of Bottom Flange Cover Plate	-18.88	-0.29
Span 2, Exterior Girders, End of Bottom Flange Cover Plate	-17.51	6.46
Span 2, Interior Girders, End of Bottom Flange Cover Plate	-13.08	28.26
Span 3, Interior Girders, End of Bottom Flange Cover Plate	-18.96	-0.65

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is less than 1% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 7 ½" with 1 ½" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 2" of concrete to provide the standard of 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" cover of concrete. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing armor bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.712 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, railing and bridge deck joints. The bridge deck will be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 7 ½" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.888 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1002132

Visual Inspection

Miscellaneous concrete and bearing repairs were made to the abutments and piers in 2002 under contract D259214.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – Bridge Deck Evaluation not required. Deck Rating was less than 5.

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have minor rust scale. Bearings on the outside pedestals have heavy rust scale.

Substructure

South Abutment – Concrete abutment, backwall, and pedestals contained minor isolated areas of delaminated concrete and cracking. There is minor rust and water staining on the back wall. Pedestal 5 contains delaminated concrete on the West face.

Pier 1 – The North and South faces of the concrete cap beam and the columns contained minor isolated areas of delaminated concrete and cracking. The pedestal concrete does not appear to be delaminated. Columns 1 and 3 contain areas of delaminated concrete.

Pier 2 – The North and South faces of the concrete cap beam and the columns contained areas of delaminated concrete and cracking. The pedestal concrete does not appear to be delaminated. Column 3 contains map cracking.

North Abutment – Concrete abutment and backwall contained minor isolated areas of delaminated concrete and cracking. There is minor rust and water staining on the back wall. Pedestals 2, 3, 4, 5, and 6 contain areas of delaminated concrete.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1002132

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

100% hands on inspection of cover plates performed – no cracks found.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

Paint had started to fail along edges of girders and webs of fascia girders.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 North Bound Bridge over Route 5. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-00213-2 Interstate Route 481 North Bound over Route 5

Type of Material	Estimated Amount
Sheet Packing	7.4 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 North Bound Bridge over Route 5 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-00213-2 Interstate Route 481 North Bound over Route 5

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slabs at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 7.4 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E
NYSPE 084915

DATE: FEBRUARY 4, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1002132 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1002132 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL F. BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 2, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1002132 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Interior Girders, End of Bottom Flange Cover Plate	-18.81	17.30
Span 2, Exterior Girder G1, End of Bottom Flange Cover Plate	-18.41	19.27
Span 2, Exterior Girder G6, End of Bottom Flange Cover Plate	-17.30	24.74
Span 2, Interior Girders, End of Bottom Flange Cover Plate	-11.93	51.18
Span 3, Interior Girders, End of Bottom Flange Cover Plate	-18.64	18.13

IN-DEPTH CONDITION DOCUMENTATION

BIN 1031501

Visual Inspection

The bridge was constructed in 1965 under contract F.A.C. 64-7 as a 2 lane structure. In 1975, under contract D95042, the original bridge was widened on the east side to accommodate an additional lane. This contract extended the abutments and added an additional set of columns with capbeam adjacent to, but not connected to the existing elements. Miscellaneous concrete repairs were completed on the deck and the columns, deck joint replacements, bearing restorations and replacement of the separate capbeams with a single continuous capbeam at each pier were completed in 2004 under contract D259778.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements were typically painted over and had varying amounts of salt accumulation.

Substructure

South Abutment – Delaminated concrete was found at 2 locations during the field investigation. The first area spans the backwall between pedestals 2 to 4 a distance of 18’-0” with a varying height from 3’-6” to 5’-0”. The second area is adjacent to pedestal 6 being 2’ wide by 4’ high. The abutment exhibited some minor cracking, salt accumulation, and ice accumulation. The deck joint above the abutment was leaking allowing water, salt, and ice to accumulate on the bridge seat and pedestals.

Piers – The three piers exhibited isolated areas delaminated concrete on the capbeams or pedestals. Also, isolated areas of delaminated concrete were found on the columns and are minor except for column 4 at the easterly end of pier 2. This column contained several full-height vertical cracks that were adjacent to areas of delaminated concrete. The joints above each pier were leaking and allowed water, salt, and ice to accumulate on the capbeam, bearings and pedestals.

North Abutment – The abutment backwall exhibited a single area of delaminated concrete between pedestals 2 and 3. The delaminated concrete covers the surface below the pedestal elevation to the finished grade. A large spall area is located between the pedestals, has an exposed rebar centered in it and extends to the top of backwall. A second portion of delaminated concrete is adjacent to this spall, extends to the center of pedestal 3 and also extends to the top of the backwall. The deck joint above the abutment was leaking allowing water, salt and ice to accumulate on the bridge seat and pedestals. The concrete cap on the cheekwall, adjacent to pedestal 8, is spalled off at each end and has several cracks that have started to spall as well. The concrete joint from prior repairs under the cap is open around the perimeter of the cheekwall showing rust stains and accumulation of salt.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1031501

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

The girders contained partial length, welded cover plates. 100% Hands-on inspection was performed, no cracks were found.

Overall Steel Condition

The steel showed no sign of major deterioration. No areas of concern were observed.

Paint

Generally, the paint appeared to be in good condition. There was minimal delaminated paint on cross frames and girders. Some rust accumulation near the bearing and below deck joints was observed.

Section Loss

Due to the age of the steel a blanket 5% section loss to the bottom flanges should be used in load rating.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the following bridges:

BIN 1-03150-1 Interstate Route 81 South Bound over Route 173
BIN 1-03150-2 Interstate Route 81 North Bound over Route 173

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the two bridges listed above (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structures were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structures, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structures. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structures at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridges or the approaches to the bridges were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-03150-1 Interstate Route 81 South Bound over Route 173
BIN 1-03150-2 Interstate Route 81 North Bound over Route 173

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 24, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031501 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1031501 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or piers. Seat width improvements are required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL F BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 112, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1031501 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Span 3 Expansion (Exp.) fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Spans 1 & 2, Interior Girders (Orig.), End of Bottom Flange Cover Plate	53.73	376.08
Spans 1 & 2, Exterior Girders (Exp.), End of Bottom Flange Cover Plate	Infinite	Infinite
Spans 1 & 2, Interior Girders (Exp.), End of Bottom Flange Cover Plate	Infinite	Infinite
Span 3, Interior Girders (Orig.), End of Bottom Flange Cover Plate	19.27	206.52
Span 3, Exterior Girders (Exp.), End of Bottom Flange Cover Plate	-3.28	95.56

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 3, Interior Girders (Exp.), End of Bottom Flange Cover Plate	-0.90	107.27
Span 4, Interior Girders (Orig.), End of Bottom Flange Cover Plate	28.51	251.99
Span 4, Exterior Girders (Exp.), End of Bottom Flange Cover Plate	62.73	420.37
Span 4, Interior Girders (Exp.), End of Bottom Flange Cover Plate	70.42	458.22

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 24% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8 ½" with 2 ½" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing 2 rail bridge railing and curbs will be removed and replaced with single-slope concrete barrier on both sides of the bridge. The existing elastomeric bridge joints will be replaced with new armorless bridge joints. The approach slabs will receive the same treatment as the deck. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 1.31 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete demolition of the bridge deck, 2-rail bridge rail with curbs and armorless bridge joints. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier, and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 8 ½" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 1.52 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1031510

Visual Inspection

The bridge was constructed in 1965 under contract F.A.C. 64-7 and has had multiple rehabilitations to various substructure and superstructure components. Miscellaneous substructure repairs, deck joint replacements and bearing restorations were completed in 2004 under contract D259742. In 2012, overhead sign structures for I-81 Southbound were added to the structure, under contract D261956. A portion of the concrete parapet with safety railing was reconstructed under this contract.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically contained rust and salt accumulation. The expansion bearings appeared to contain pack rust and were not functioning as intended.

Substructure

West Abutment – No delaminated concrete was found during the field investigation. The abutment exhibited map-cracking, salt accumulation, and ice accumulation. The conduits and utility pipes were severely deteriorated at the entrance to the backwall. The deck joint above the abutment was leaking allowing water, salt, and ice to accumulate on the bridge seat and pedestals.

Pier – The pier exhibited widespread map-cracking. Isolated areas of delaminated concrete existed on the pedestals, and columns.

East Abutment – The abutment exhibited widespread map-cracking with isolated areas of delaminated concrete. The deck joint above the abutment was

leaking allowing water, salt and ice to accumulate on the bridge seat and pedestals. The backwall contained an isolated spall above pedestal 5.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1031510

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

The girders contained partial length, welded cover plates. 100% Hands-on inspection was performed, no cracks were found.

Overall Steel Condition

The steel showed no sign of major deterioration. No areas of concern were observed.

Paint

Generally, the paint appeared to be in good condition. There was minimal delaminated paint on cross frames and girders. Some rust accumulation near the bearing and below deck joints was observed.

Section Loss

Due to the age of the steel a blanket 5% section loss to the bottom flanges should be used in load rating.

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the East Glen Avenue Bridge over Interstate Route I-81. Based on laboratory analyses of bulk samples collected, the following materials were determined to contain asbestos:

BIN 1-03151-0 East Glen Avenue over Interstate Route I-81

Type of Material	Estimated Amount
Sheet Packing	6 Square Meters
Caulking Compound	3.4 Linear Meters *

* Indicates approximate amount of caulking compound located on the bridge itself. An additional 110 linear meters of caulking compound are located in the expansion joints on the east and west retaining walls of the bridge. See report.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the East Glen Avenue Bridge over Interstate Route I-81 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-03151-0 East Glen Avenue over Interstate Route I-81

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 6 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Caulking Compound

Asbestos-containing caulking compound is located around some of the guide rail base plates on both the north and south parapet walls of the bridge. This caulking compound is in fair condition and covers approximately 3.4 linear meters. This estimate is based on field measurements taken at the time of the site visit.

An additional 110 linear meters of caulking compound are located in the expansion joints on the east and west retaining walls of the bridge. This caulking compound is also in fair condition, exhibiting some sign of weathering in many locations.

The approximate locations of this asbestos-containing culking compound are shown and noted in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 24, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031510 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1031510 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL F. BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 4, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1031510 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have **not** been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Interior Girders, End of Bottom Flange Cover Plate	1079	5487
Span 2, Interior Girders, End of Bottom Flange Cover Plate	602	3139

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 13% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8” with 1” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1 ½” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing parapet wall and safety walk along the north side of the bridge will be removed and replaced with a single-slope concrete barrier. The existing parapet wall and 4’-7” wide sidewalk along the south side of the bridge will be removed and replaced with a 5-foot wide sidewalk and vertical-faced concrete barrier with pedestrian fence attached to the top of the barrier. The existing elastomeric bridge joints will be replaced with new armorless bridge joints. The approaches will also be

resurfaced. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.611 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, elastomeric bridge deck joints, parapet wall and safety walk with curb from the north side of the bridge and the parapet wall and sidewalk with curb on the south side of the bridge. The bridge deck would be replaced with a new concrete deck, new sidewalk and curb with vertical faced parapet concrete barrier and pedestrian fencing on top of the barrier on the south side of the bridge and new single-slope concrete barrier on the north side of the bridge and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 8" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.605 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1031539

Visual Inspection

The bridge was originally built under contract F.I.C. 64-7. New armored joints and guide rail were installed under contract D253087 (‘87). Under contract D259742 Part 1 (10/04) concrete repairs to abutments and piers, armorless joints, and bearing restoration was performed. Part 2 (12/04) The fascia concrete parapets were removed to curb height, existing 2 railing system remained, and the enclosed 2” lighting conduit placed on the fascia sides. Under contract D261956 (12/11) a concrete median barrier was installed and full depth patches to the deck were done. Under contract D262431 new armorless joints will be installed above the piers.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report.

Steel – See Structural Steel Inspection Summary.

Bearings – Bearings are original. Bearings were restored under contract D259742 (4/04) with sheared anchor bolts replaced, new bronze sliding plates installed, and exp. bearings repositioned where needed. All bearings (fixed) on the South (beginning) abutment, pier bearings (fixed & exp. at both piers) and North (end) abutment (exp.) suffer paint loss to varying degrees with those below the leaking parts of the joints and fascias in worst condition. The bearings were rated 5 or 6 during the Biennial inspection.

Substructure

South Abutment (Begin) – The beginning left cheek wall is map-cracked throughout, however, there are heavier cracks with efflorescence (efflo) seepage in the wall at the top of the pedestal (ped) and across the inside face. There is full height moisture with efflo buildup on the backwall and pedestals at ped 3, between ped's 4 & 5, 7, 8, and 16. The longitudinal joint in the deck above and between ped's 7 & 8 is very porous and the moisture content at these ped's is high. The efflo buildup behind ped 16 is high with cracking and has resulted in full height spalling to 4" deep by 6" wide in the backwall corner with the 'U' wingwall. There is an existing cheekwall adjacent to ped 1 however; there is no existing cheekwall adjacent to ped 16. It appears the beginning right wingwall was prepared for resurfacing but never completed so now there is full height spalling to 4" deep by 48" wide back from backwall corner.

Pier #1 – The first four columns support the left capbeam and pedestals 1 – 7 while the next 5 columns support the right capbeam and pedestals 8 – 16, typical for Pier 2. Column 1 has a 2' wide by 4" high delamination (delam) on the begin face. All other columns in good condition. The capbeam has 2' wide by 2' high delams on both begin & end faces below ped 1. There is a 1'wide by 1' high delam on the begin face below right edge of ped 8. There is a horizontal crack with delaminated concrete in the end face 3" below the top edge between ped's 8 & 9. There is a 1' wide by 1' high delam on the begin face below right edge of ped 12. There is heavy map-cracking across the end face between ped's 14 & 15 and a sliver of efflo on the begin face at the left edge of ped 15. On the begin face directly below ped 16 the concrete is delaminated 3' high by 6' wide. There is active moisture and efflorescence build-up on and across and down the capbeam for pedestals 3, 5, 9, 10, 11, and 12. The back (end) edges of ped 7 for the span 1 have broken off clean leaving the masonry plate of the

bearing in the corner (1” by 1”) unsupported. There is map cracking across the right fascia and end faces of ped 16.

Pier #2 – All columns are in good condition except for column 16 which has a delaminated area 4’ high by 6’ wide on the begin face which wraps into the left face. Column 6 has full height efflo stains and water dripping on the begin face but is still in good condition. Ped 1 has minor vertical cracking in the middle of begin face for 6” wide. The capbeam has punky concrete for 3” high for 12” wide below ped 1 on the left begin & end faces and map cracking below ped 8 on the begin face. There is efflorescence and moisture build-up on and across and down the capbeam for pedestals 3, 5, 6, 7, 8, 10, 11, and 12. There are delaminated areas at ped 3; 1’ wide by 1’ high on end face, ped 7; 2’ wide by 1’ high on end face, below ped 14; 2’ wide by 2’ high on begin face, between ped’s 15 & 16; 2’ wide by 2’ high on end face, below ped 16; 6” high by 2’ wide on begin face, and on ped 16; 4’ wide by 1’ high on the begin face.

North Abutment (End) – It appears the end left wingwall was prepared for resurfacing but never completed so now there is full height spalling to 4” deep by 48” wide back from backwall corner. The backwall in this corner is also spalled with cracking and bleeding efflo. There is efflorescence and moisture build-up on the backwall and across the pedestals at ped’s 3, between 4 & 5, 7, 9, 12, and 16. The joint filler material is missing above pedestals 9 & 16. There is concrete debris from the deck haunch between ped’s 3 & 7. Behind ped 11 there is a delam 12” wide by full height. All of the pedestals are in good condition except for the moisture and efflorescence build-up and minor map cracking on pedestal 1. The end right cheekwall is in good condition.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1031539

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – Yes; partial length coverplates on interior girders.
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details

100% hands-on inspection was performed – a crack was found as detailed below.

Overall Steel Condition

Due to porous joints there is section loss in localized specific areas occurring in the steel below. This has been an ongoing condition resulting in a couple of different repairs to girders in the past. Except for the excessive losses detailed below, the steel is in good condition.

Paint

The paint has failed in all locations where the joints leak which includes the abutments, piers, and longitudinal deck joints and section loss is beginning to occur with excessive losses as detailed below. In all other locations the paint is in good condition.

Section Loss

There is localized excessive section loss at the following locations. At the end of Span 1, girder #7 has bottom flange loss of 15% for the last 18", as does the web at the bottom flange for a height of 3". There is additional web loss above the 3" previously mentioned for the last 12" by full height of 15%. There is comparable loss in the connection plates below the cross bracing from girder to girder. At the beginning of Span 3, girder #7 has bottom flange loss of 15% for the first 18". There is comparable web loss but at this time the loss remains mostly behind the centerline of the bearing. There is comparable loss in the connection plates below the cross bracing from girder to girder. At girder #16, Span 3, there is a small crack in the side (vertical edge) of the bottom flange in the area between the end of the full length cover plate and the beginning bearing face. NYSDOT was notified of this condition. The crack could have developed because the flange in this area had become so thin. The section loss for the bottom flange in this area is averaged to 55% in the range from 3.0" to 6.0" from the centerline of the beginning bearing. The Span 2, G-16 connection plate at this location previously thinned and cracked, where upon it was replaced and web stiffeners were also added to the Span 3, G-16 girder. None of the girders were originally constructed with web stiffeners.

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-81 bridge over East Brighton Avenue. Based on laboratory analyses of bulk samples collected, no materials were determined to contain asbestos.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-81 bridge over East Brighton Avenue. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1031539 Interstate Route I-81 over East Brighton Avenue

Based on laboratory analyses of bulk samples collected, no materials were determined to contain asbestos.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 25, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031539 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1031539 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or piers. Seat width improvements are required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 4, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1031539 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of all of the North Bound (NB) fatigue components and the South Bound (SB) fatigue components at Span 2 Interior (Girder S8) have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1 NB, Exterior Girder S4, End of Bottom Flange Cover Plate	-15.68	97.50
Span 1 NB, Interior Girders S5, End of Bottom Flange Cover Plate	-13.61	107.70
Span 2 NB, Exterior Girder S10, End of Bottom Flange Cover Plate	-20.52	73.67
Span 2 NB, Interior Girders, S11, End of Bottom Flange Cover Plate	-18.93	81.49
Span 3 NB, Exterior Girders S16, End of Bottom Flange Cover Plate	-16.04	95.72

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 3 NB, Interior Girders S17, End of Bottom Flange Cover Plate	-13.93	106.09
Span 1 SB, Exterior Girder S3, End of Bottom Flange Cover Plate	13.24	239.78
Span 1 SB, Interior Girders S2, End of Bottom Flange Cover Plate	0.41	176.66
Span 2 SB, Exterior Girder S9, End of Bottom Flange Cover Plate	8.81	218.03
Span 2 SB, Interior Girders S8, End of Bottom Flange Cover Plate	-4.16	154.18
Span 3 SB, Exterior Girder S15, End of Bottom Flange Cover Plate	4.93	198.90
Span 3 SB, Interior Girders S14, End of Bottom Flange Cover Plate	5.57	202.04

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 12% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction by exposing the top mat of rebar over the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8” with 2” concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1 ½” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing non-conforming 2-rail bridge railing will be removed and replaced with single-slope concrete barrier. The existing armorless bridge joints will be replaced with new armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 2.00 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the existing bridge deck, 2-rail bridge railing and curbs, and armorless bridge deck joints. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 8" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 2.43 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1031610

Visual Inspection

Miscellaneous concrete repairs were made to the abutments and piers in 2004 under contract D259742.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have minor rust scale.

Substructure

South Abutment – The South Abutment contained cracks, spalls, and delaminated concrete. The abutment stem contained minor isolated areas of delaminated concrete and cracking. The pedestals and back wall concrete did not appear to be delaminated however; the back wall contained significant rust staining from deteriorated stay-in-place deck forms. The steel stay-in-place deck forms exhibited significant deterioration and in some cases 100% section loss against the back wall.

Pier 1 – The north and south faces of the concrete cap beam and the columns contained minor isolated areas of delaminated concrete and cracking. Pedestal 8 exhibits a small, isolated spall.

Pier 2 – The North and South faces of the concrete cap beam and the columns contained areas of delaminated concrete and cracking. Pedestals 2, 3, 4, and 8 contain delaminated concrete.

North Abutment – The abutment stem contained large, wide-spread areas of delaminated concrete and map cracking throughout the wall. The pedestal and

back wall concrete does not appear to be delaminated. The steel deck pan exhibited rust against the back wall.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1031610

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – No

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

No Special emphasis details.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed. There was a uniform patina on the entire steel structure, indicating the weathering seal was performing as intended.

Paint

The bridge contained weathering steel, there was no paint.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E
NYSPE 084915

DATE: FEBRUARY 10, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031610 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1031610 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 10% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8 ½” with 2 ½” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing vertical-faced concrete parapet and sidewalk will be removed and replaced. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. Option 2 would provide a service life of 35 years to the bridge deck. The construction cost of this option is $3.50 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, sidewalk, vertical-faced concrete parapet, bridge deck joints and approach slabs. The bridge deck will be replaced with new sidewalks, vertical-faced concrete parapets and new armorless bridge joints. The approach slabs will also be replaced under Option 3. The new bridge deck would be 9 ½" standard thickness as compared to the 8 ½" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. Option 3 would provide a service life of 40 years to the bridge deck. The construction cost of Option 3 is $3.95 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1031711

Visual Inspection

Miscellaneous concrete repairs were made to the abutments and approach slabs in 2002 under contract D259214. Deck joints were also replaced under this contract.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have minor rust scale.

Substructure

East Abutment – Concrete back wall contained minor isolated areas of delaminated concrete and cracking. The stem contained cracks, spalls, and delaminated concrete. Pedestal locations 2, 3, 5, and 6 all exhibited minor cracking; the pedestal and stem concrete did not appear to be delaminated.

Pier – The east face of the concrete cap beam and the north and center columns contained areas of delaminated concrete and cracking. Pedestal 6 exhibited minor cracking and spall.

West Abutment – Concrete back wall and stem contained minor areas of delaminated concrete and cracking throughout the wall. Pedestal locations 1, 2, and 3 all exhibited minor cracking. Pedestal 6 contained delaminated concrete on the southwest edge.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1031711

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – No

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

No Special emphasis details.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed. There was a uniform patina on the entire steel structure, indicating the weathering seal was performing as intended.

Paint

The bridge contained weathering steel, there was no paint.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over Interstate Route I-81. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over Interstate Route I-81. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1031711 Interstate Route I-481 South Bound over Interstate Route I-81

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E**
NYSPE 084915

DATE: **FEBRUARY 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1031711 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1031711 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 1% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8 ½” with 2 ½” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. Option 2 would provide a service life of 35 years to the bridge deck. The construction cost of this option is $1.26 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, railing, bridge deck joints and approach slabs. The bridge deck will be replaced with updated single-slope concrete barrier and new armorless bridge joints. The approach slabs will also be replaced under Option 3. The new bridge deck would be 9 ½" standard thickness as compared to the 8 ½" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. Option 3 would provide a service life of 40 years to the bridge deck. The construction cost of Option 3 is $1.35 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1031712

Visual Inspection

Miscellaneous concrete repairs were made to the abutments and approach slabs in 2002 under contract D259214. Also under this contract, the bridge deck joints were rehabilitated.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically had minor rust scale. Bearing 10 was missing a nut and Bearing 9 had a nut only partially engaged.

Substructure

East Abutment – Concrete back wall contained isolated areas of delaminated concrete and cracking. The stem contained cracks, spalls, and delaminated concrete. Pedestal locations 10, 11, and 12 all exhibited cracking; the pedestal and stem concrete did not appear to be delaminated.

Pier 1 – The west and north faces of the concrete cap beam and the northernmost and center columns contained areas of delaminated concrete and cracking. Pedestals 7 and 12 exhibited cracking and spalls.

West Abutment – Concrete back wall contained minor areas of delaminated concrete and cracking throughout the wall. The stem contained cracks, spalls, and delaminated concrete. The stem at pedestal 7 contained a delaminated concrete with a 3-inch-deep spall on the corner of the stem. Pedestal locations 8 and 11 exhibited minor cracking.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1031712

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – No

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

No Special emphasis details.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed. There was a uniform patina on the entire steel structure, indicating the weathering seal was performing as intended.

Paint

The bridge contained weathering steel, there was no paint.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over Interstate Route I-81. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over Interstate Route I-81. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1031712 Interstate Route I-481 North Bound over Interstate Route I-81

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E**
NYSPE 084915

DATE: **FEBRUARY 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1031712 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1031712 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or pier. Seat width improvements are required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 1% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8 ½” with 2 ½” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. Option 2 would provide a service life of 35 years to the bridge deck. The construction cost of this option is $1.27 million.

Option 3 – Bridge Deck Replacement

This option will involve the complete demolition of the existing bridge deck, railing, bridge deck joints and approach slabs. The bridge deck will be replaced with updated single-slope concrete barrier and new armorless bridge joints. The approach slabs will also be replaced under Option 3. The new bridge deck would be 9 ½" standard thickness as compared to the 8 ½" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. Option 3 would provide a service life of 40 years to the bridge deck. The construction cost of Option 3 is $1.35 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1044440

- **In-Depth Condition:**

Visual Inspection: Original plans indicate the bridge was built under contract F.I.S.H. 61-17. Two distress cracks in the structure were addressed under contract D 258315 dated 10/ 99.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** There is no Bridge Deck to evaluate. Structure is a two cell concrete box culvert.
- **Steel –** There is no Structural Steel to inspect. Structure is a two cell concrete box culvert.
- **Bearings –** There are no bearings for this structure. Structure is a two cell concrete box culvert.

Substructure

Structure is a two cell concrete box culvert. The bridge is orientated North. The inlet is on the left and outlet on the right. The culvert was done with four individual pours from left to right.

Two prominent distress cracks have developed in pour 2 which were attended to under contract D58315 (10/99). These cracks run the entire length of the bridge in the top slab and then down all three walls of the structure, both sides of pier wall. The cracks straddle the left pavement stripe of I481 WB/SB. The cracks are still an issue for this structure.

During our inspection we found the areas around these cracks in the top slab to have deep hollowness which included the concrete patches adjacent to the cracks for 6”-18” on either side of the crack with heavy efflorescence seepage throughout.

The left vertical crack (crack closet to pour 1/2 joint) thins out as it progresses down all walls with light efflorescence seepage. The right crack slightly thins as it also progresses down all walls but goes from heavy to light seepage on the abutment walls and heavy to moderate on the pier walls .

In addition to the two distress cracks:

- **Begin (south) Abutment –** The rest of the wall in good condition expect for moderate seepage in pour 1/2 ceiling joint and moderate seepage in pour 2/3 ceiling and wall joint.
- **Pier –** The begin wall has light seepage in pour 1/2 joint and moderate seepage in 2/3 joint. Shallow hollowness in pour 2 left side 2' by 4'. The end wall has light seepage in pour 1/2 wall and ceiling joint and moderate seepage in pour 2/3 wall and ceiling joint.
- **End (north) Abutment –** The end wall has moderate seepage in ceiling1/2 joint and moderate seepage in pour 2/3 wall and ceiling joint.
- **Fascias –** The left fascia has some map cracking 1' by 2' in top end right. The right fascia has some cracking and delamination 1' by 2' near top of juncture with right end wingwall. A couple minor cracks over pier.
- **Wingwalls –** The bridge and wing walls were built with "no" piles**.** Both inlet and outlet have suffered scour conditions. Under contract D258315 a heavy stone scour retrofit was established for the inlet only, however, heavy stone has been placed across the outlet also. The wings have slighted settled and moved away from the stems. The worst case is the beginning right wing is slightly tilting forward.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069090

- **In-Depth Condition:**

Visual Inspection: Miscellaneous concrete repairs were made to the abutments and piers in 2005 under contract D259742.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** See Bridge Deck Evaluation Report.
- **Steel –** See Structural Steel Inspection Summary.
- **Bearings –** All expansion bearings (spherical) appear in good working order, however, they are closer to the right keeper plate than the left. This is the inside side of the curved girder. There is some minor rust on a few fascia bearings. The fixed bearings (spherical - piers 2 & 4) also appear in good working order with minor rust buildup on them.

Substructure

- **West Abutment (Begin) –** Some cracking with shallow spalling for 3' high between pedestals 2 & 3 in the backwall. Light delaminations in same area between pedestals 3 & 4. Thin full height crack behind pedestal 4. Right cheek wall is spalled to 6" deep at the top front face with hollowness on the outside wall 6" W by 4' H.

  Pier #1 – Pier is overall in good condition except for a single for 2' H by 3' W area on the beginning face which has a minor spall with swallow delamination around it.

  Pier #2 – Seepage from road splash on the low side (right) has led to staining of the concrete with a cracked fascia pedestal and spot areas of delaminations on the bottom side of the hammerhead capbeam. Minor spalls with localized delaminations on pedestals 2,3, & 4 and just below on the capbeam on both faces.

Pier #3 – Pier #3 is the only pier with a joint and there is extensive map cracking with efflorescence build up on the pedestals, capbeam, and column. Some minor cracking with localized delamination below pedestal 4, beginning face, and on and below pedestal 2 & 3 on the end face.

Pier #4 – The pier is basically sound and solid.

East Abutment (End) – There is heavy staining with efflorescence build up which runs down the backwall over the pedestals and down the stem at pedestals 1,2, & 5. A single spall measuring 18" W by 18" H by 8" deep in top right corner of backwall. Mapcracking on abutment from pedestal 1 to pedestal 2 and between pedestals 3 & 4.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1049659

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – Yes
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details:

Partial length cover plates. Safe life had exhausted when analyzed in 1996.

Overall Steel Condition:

Right fascia of Span #2 suffered an impact at the third diaphragm from the joint which places it near midspan. A repair was made and a outward bulge of 1-2" in the web still remains which measures approx. 36"W by 30"H. Pockets of section loss occur as detailed below.

Paint: Paint has failed along edges of all girders and webs of fascia girders. There are pockets of total paint loss at pier joints adjacent longitudinal joint and pier fascia ends

Section Loss: There are localized pockets of section loss starting with girder:
G-1 over pier #1; spans #1 & #2, webs and both flanges have +/- 10% loss for first and last 6" of girder. G-8 over pier #1; span #2; web's top 6" for first 3" has +/-10% loss as does the top flange for first 12". G-8 over pier #2; span #2, web and flanges have 10% loss for last 6". G-14 over pier #1; span #1, bottom flange for last 3' has an average loss of +/- 5%. G-14 over pier #1; span #2, bottom flange for first 5' has an average loss of +/- 5%. G-14 over pier #2; span #2, bottom flange for last 5' has an average loss of +/- 5%. G-14 over pier #2; span #3, bottom flange for first 5' has an average loss of +/- 5%

Site Test: Test performed with calibrated D-Meter.

Location: Bottom flange outside right fascia girder 14 span 1.

Findings:

-Typical as built thickness reading: 0.834 inches
-Thickness at isolated area of heavy loss: 0.678 inches

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 5, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1049659 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1049659 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments and piers. Seat width improvements are required at the begin and end abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 14, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1049659 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 2, Interior Girders S5, End of Bottom Flange Cover Plate	-42.24	-4.56
Span 2, Exterior Girders S6, End of Bottom Flange Cover Plate	-47.27	-29.29

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 3% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 11” with 5 ½” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing 2-rail bridge railing and curbs will be removed and replaced with single-slope concrete barrier on the outside of the bridge. The existing bridge joints will be replaced with new armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 1.216 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, elastomeric bridge deck joints, and 2-rail bridge rail with curbs and pedestrian fencing along the outside of the bridge. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier, and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 11" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 1.354 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

BIN 1050759

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, and deck joint replacement. Miscellaneous abutment and joint repairs were made along with new bearings in 2006 under contract D260442. The structural steel was painted in 2010 under contract D261472.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – Bridge Deck Evaluation not required. The Bridge Deck rating from 2012 is less than 5

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically had minor isolated rust scale

Substructure

West Abutment – The concrete backwall, pedestals, stem, and wingwalls contained minor isolated areas of delaminated concrete and cracking. The backwall had areas of moisture stains and efflorescence, typically on the ends and under the center joint. Rust stains were present on the south end of the stem and on the northwest wingwall. Joint material was missing in the center construction joint.

East Abutment – The concrete pedestals, stem, and wingwalls contained only minor isolated areas of delaminated concrete and cracking. The backwall had a small area of spall behind pedestal G9. The backwall had areas of moisture stains and efflorescence, typically on the ends and under the center joint. Rust

stains were present on the southeast wingwall. Joint material was missing in the center construction joint.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1050759

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Cover plate welds: 100% Hands-on inspection performed – No cracks found.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

The paint appeared to be in good general condition with only minor isolated areas of rust. The steel was painted in 2010 under contract D261472.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

NOTES:

1. SOME REPAIR AREAS WERE ESTIMATED FROM VISUAL ASSESSMENT ONLY. THE CONTRACTOR SHALL SOUND THE CONCRETE TO DETERMINE THE REPAIR LIMITS. REPAIR LIMITS SHALL INCLUDE AN AREA A MINIMUM OF 150 mm BEYOND EACH SIDE OF THE UNSOUND CONCRETE. THESE LIMITS SHALL BE APPROVED BY THE E.I.C. ADDITIONAL CRACKS, NOT INCLUDED IN REPAIR AREAS FOR ITEM 582.05 - REMOVAL OF STRUCTURAL CONCRETE, REPLACEMENT WITH CLASS A CONCRETE, TO BE REPAIRED, SHALL BE APPROVED BY THE E.I.C.
2. THE CONTRACTOR SHALL SAW CUT TO A DEPTH OF 19 mm AT THE EDGE OF ALL REPAIR AREAS. DO NOT CUT ANY REINFORCEMENT BARS. PAYMENT FOR THIS WORK SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE CONCRETE REMOVAL ITEM.
3. THE PEDESTALS SHALL BE REMOVED ENTIRELY AND REPLACED TO THE PROPOSED ELEVATIONS. REFER TO DWG. PE-1 FOR EXISTING AND PROPOSED ELEVATIONS. THE CONTRACTOR SHALL ADJUST NEW ELEVATIONS BASED ON THE ACTUAL HEIGHT OF THE NEW BEARINGS PROVIDED.
4. EXISTING REBAR IN THE ABUTMENT, STEM WALLS, U-WALLS AND BACKWALLS THAT ARE ENCOUNTERED SHALL REMAIN IN PLACE. REBAR THAT HAS GREATER THAN 25% SECTION LOSS, IN THE OPINION OF THE E.I.C., SHALL BE REPLACED WITH THE SAME SIZE AND TYPE OF THE EXISTING REBAR ACCORDING TO THE DETAILS SHOWN ON DWG. PE-2. IF WELDED, WELDERS SHALL BE QUALIFIED IN ACCORDANCE WITH THE NEW YORK STATE STEEL CONSTRUCTION MANUAL. FOR WELDING DETAILS, REFER TO SECTION 7 OF THE NEW YORK STATE STEEL CONSTRUCTION MANUAL.
5. THE COST OF REPLACING EXISTING STEEL REINFORCING IN ABUTMENTS, U-WALLS AND BACKWALLS, INCLUDING SPLICING AND WELDING, SHALL BE PAID IN ACCORDANCE WITH ITEM 556.0201, UNCOATED BAR REINFORCEMENT FOR CONCRETE STRUCTURES
6. REFER TO DWG. BD-4 FOR REBAR SPLICING, SACRIFICAL ANODE & CHAMFER DETAILS.
7. THE CONTRACTOR SHALL APPLY A COATING-TYPE PROTECTIVE SEALER TO ALL SUBSTRUCTURE CONCRETE AFTER COMPLETION OF REPAIRS (PEDESTALS, BACKWALLS, STEMWALLS, ETC). PAYMENT TO BE MADE UNDER ITEM 559.1696 18 - PROTECTIVE COATING FOR STRUCTURAL CONCRETE. THE COATING SHALL BE APPLIED IN SUCH A MANNER AS TO OBTAIN A UNIFORM APPEARANCE OVER THE ENTIRE STRUCTURE ONCE THE COATING HAS CURED.
8. PEDESTAL REINFORCEMENT HOOPS ARE TO BE REPLACED USING ITEM 556.0202 - EPOXY COATED BAR REINFORCEMENT FOR CONCRETE STRUCTURES. ALL HOOPS ARE TO BE REPLACED; SAME SIZE AND SAME SPACING. THE MINIMUM COVER OVER REINFORCEMENT ON THE PEDESTALS SHALL BE 50 mm. THE COST OF ANY MODIFICATIONS TO THE EXISTING REINFORCEMENT IN THE PEDESTALS (SUCH AS BENDING OR CUTTING) SHALL BE INCLUDED IN THE PRICE BID FOR ITEM 580.01 - REMOVAL OF STRUCTURAL CONCRETE. REPLACEMENT OF REINFORCEMENT TO BE PAID FOR UNDER ITEM 556.0202 - EPOXY COATED BAR REINFORCEMENT FOR CONCRETE STRUCTURES. REFER TO DWG. BD-3 FOR PEDESTAL BAR REINFORCEMENT TABLE.
9. IT SHALL BE THE CONTRACTOR'S RESPONSIBILITY TO CONFIRM THE ACTUAL HEIGHT OF EACH EXISTING BEARING TO BE REPLACED PRIOR TO THE FABRICATION OF THE REPLACEMENT BEARINGS.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E**
NYSPE 084915

DATE: **FEBRUARY 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1050759 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1050759 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 4, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1050759 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Interior Girder fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders G1 & G7, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 1, Interior Girders G2 to G6, End of Bottom Flange Cover Plate	-22.65	55.55
Span 1, Exterior Girder G8, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 1, Interior Girders G9 to G13, End of Bottom Flange Cover Plate	-22.24	57.57
Span 1, Exterior Girder G14, End of Bottom Flange Cover Plate	Infinite	Infinite

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1050779

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation, miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, and deck joint replacement.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have rust, with numerous bearings having pack rust.

Substructure

West Abutment – The concrete pedestals and wingwalls contained minor isolated areas of delaminated concrete and cracking. The backwall had sections of spalled concrete between pedestal 1 and the northwest cheekwall and between pedestals 8 and 9. Efflorescence was noted between pedestals 9 and 10 and a rust stain was above pedestal 11. The stem contained delaminated and cracked concrete below pedestals 1, 7, and 8, with a section of spall below pedestal 7.

West Abutment – The concrete backwall, pedestals, and wingwalls contained minor areas of delaminated concrete and cracking. Efflorescence was on the backwall between pedestals 1 and 2 and between pedestals 8 and 9. The stem contained spalled concrete below pedestal 1 and delaminated concrete below pedestals 1, 9, and from 12 to 16.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1050779

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Cover plate welds: 100% Hands-on inspection performed – No cracks found.

Overall Steel Condition

The steel showed no sign of major deterioration.

Paint

The bridge paint is flaking off on the flanges and some web areas. Some locations have received “touchup” painting.

Section Loss

The section for girder 16 was measured in 2 locations. The specified web thickness from record plans was 0.625”. At the east corner of the girder, the web was measured at 0.548”, giving a section loss of 12%. At 10’ from the east corner, the web was measured at 0.596”, giving a section loss of 5%.

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 5, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1050779 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1050779 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 4, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1050779 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the interior fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders G1 and G6, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 1, Interior Girders G2 and G3, End of Bottom Flange Cover Plate	-28.91	24.75
Span 1, Interior Girders G4 and G5, End of Bottom Flange Cover Plate	-24.70	45.44

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 40% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¾” with nearly 4” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing non-conforming parapet walls, curbs and railing will be removed and replaced with single-slope concrete barrier. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.659 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, bridge deck joints, single-slope barrier along the median and parapet walls down to the existing steel girders. The bridge deck would be replaced with a new concrete deck, single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thicknesses as compared to the 9 ¾" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.754 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1051159

Visual Inspection

A new monodeck, parapets, and approaches were installed in 2012 under contract D262027.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – Bridge Deck Evaluation not required. A new deck was installed in 2012.

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have rust scale, with outer bearings having heavy rust scale.

Substructure

West Abutment – The concrete backwall contained spalling concrete on the south end above pedestals 11 through 14. The concrete stem contained areas of delaminated concrete beneath pedestals 12 through 14. Full height cracks in the stem are located south of pedestals 3, 5 and 12. The pedestals contained minor isolated areas of delaminated and cracked concrete. The construction joints near pedestals 6 and 10 have water seepage to ground level.

East Abutment – The concrete backwall contained minor isolated areas of delaminated concrete and cracking. The stem exhibited delaminated concrete beneath pedestals 13 and 14. Pedestal 7 and 8 contained areas of spalling concrete on the west faces. The construction joints near pedestals 5, 11, and 14 have water seepage to ground level.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1051159

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

The cover plate welds on the interior tension flanges require 100% hands on inspection. The safe life was exhausted in 1996. Upon inspection no defects were observed.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

The paint showed signs of deterioration with rust starting to show on the edges of the steel.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

General Notes:

- The construction joints exhibit water seepage to ground level.
- The concrete wingwalls appeared in good condition with only minor isolated delamination and cracking.
- In general, the delamination identified sounded shallow and may not go behind rebar.
- All bearings have typical rust

STEEL STRUCTURE

- Steel appears to be in good condition with less than 5% loss.
- Welds on cover plates. Appear in good condition with no visible cracks.
- Paint is failing in places and is flaking off.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 690 Bridge over Peat Street. Based on laboratory analyses of bulk samples collected, the following materials were determined to contain asbestos:

BIN 1-05115-9 Interstate Route 690 over Peat Street

Type of Material	Estimated Amount
Sheet Packing	18.6 Square Meters
Caulking Compound	6.4 Linear Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 690 Bridge over Peat Street (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-05115-9 Interstate Route 690 over Peat Street

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 18.6 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Caulking Compound

Asbestos-containing caulking compound is located around some of the guide rail base plates on the south parapet of the bridge. It is estimated that the total amount of this caulking compound is approximately 6.4 linear meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this material are shown in the attached FIGURE 2. Analytical results of bulk samples collected are summarized in the attached TABLE.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 7, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051159 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1051159 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 14, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1051159 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Interior Girders S2-S6, S9-S13, End of Bottom Flange Cover Plate	-30.68	19.17
Span 1, Exterior Girders S7 and S8, End of Bottom Flange Cover Plate	-31.56	14.84

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1051160

- **In-Depth Condition:**

Visual Inspection: Under contract D259782 (11/04) concrete restoration of abutments and piers was performed along with an overlay, bearing restoration (see below), and guiderail replacement.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** See Bridge Deck Evaluation Report.
- **Steel –** See Structural Steel Inspection Summary.
- **Bearings –** Bearings are original. The expansion type slide over a bronze plate. Under Contract D259782 all bearings were restored and at the fixed bearing a new type #38 anchor bolt replaced the originals; at the expansion bearing, the type #38 bolt was added in between the two originals per each side of the bearing. Bearings show paint loss, some rusting, and pack rust debris build up. The 2013 Biennial inspection rated all the bearings at '5'.
- **Utilities-** There are two utility ducks in the left fascia bay across the length of the bridge, a 24" gas main and a 20" water main. There numerous kinks and excessive section loss on the water main so it might be an abandoned pipe. Pack rust has busted the weld between the bottom plate and angle section for the hanger brackets in at least three locations. These conditions are well documented in the Biennial inspection reports.

- **Substructure**
  - **South Abutment (Begin) –** Snow pack and water are draining through the gaps between the deck and cheek walls causing moisture

to be present constantly on the backwalls and pedestals in that area. Additionally, there is efflorescence build up on the backwall between the pedestals 1 & 2, around 5, 6 has a rust stain on front face, between 7 & 8 and behind 8. Minor hollowness in areas of buildup. Cheek and wing walls in good condition.

- **Pier #1 (south) –** Column 2 has a 5' L vertical crack on the far right side of the beginning face with delaminated concrete on either side of the crack to 3" W. The capbeam, on the end face, has a single 2" dia. by 2" D spall, solid concrete around the spall, between pedestals 1 & 2. There also is horizontal cracking with spalled and delaminated concrete on the bottom corner between columns 3 & 4 for 15' by 9" H. Pedestals 4 & 5 have some delamination on the end faces. Localized map cracking is present through-out pier elements.

- **Pier #2 (middle) -** Heavy leakage through the joint has led to a concentrated area of delamination and cracking on the beginning and bottom faces for 7' W by full height and width between pedestals 7 & 8. Additionally, the right face of column 4 has an 8" long map crack that has opened up which runs through the pedestal and capbeam and a 12" W by 36" L delaminated area at mid height. Localized map cracking is present through-out pier elements.

- **Pier #3 (north) -** Column 1 is in good condition. Column 2 has a 10" by 10" spall, solid concrete surrounding the spall, at the top on the begin face and a 2' by 2' delam at the top on the end face. Column 3 has a 4.5' H by "half the diameter" of the column on the right face 1.5' from the top. 1.5' below this delam on the end face there is another delam measuring 2.5' by 2.5'. Column 4 has heavy concentrated area of map cracking across upper 2/3's of column which extends into the capbeam. The capbeam on the begin face has horizontal hairline cracking near the bottom between columns 1 &1 and 2 & 3. There is

associated delamination for 2.5’ L by 1’ H with the crack between columns 2 & 3. Similar cracking with map cracking on end face between columns 1 & 2.

- **North Abutment (End) –** There is heavy and light seepage through the top of backwall/deck haunch cold joint leaving a buildup of efflorescence on the backwall and down across the pedestals. The heavier built up areas include from the left cheekwall through to pedestal 2, between pedestals 3 & 4, and from the right cheekwall over to pedestal 7. Water seeping below the utility pipes in the left fascia bay has left rust stains on abutment elements below. Cheek and wing walls in good condition.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1051160

Special Emphasis Inspection Required
Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – **Yes**
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details: Partial length cover plate welds on all interior girders on spans 2, 3, & 4. Span 1 has no cover plates. Spans 2, 3, & 4 have full length cover plates on all fascia girders.

Overall Steel Condition: Girders are in satisfactory condition with the exception of numerous impacts to the beams. The left fascia girder of span 2 (I690EB) has numerous impacts, some of these impacts are deep gouges with rough sharp edges which has produced minor distortions in the bottom flange of the girder. A few less severe impacts occur in other girders. Secondary cross members are generally in good condition except for rust building up on some of those below the joints.

Paint: Paint is peeling and blistering on all lower flanges of girders in areas over traffic and below all joints; same condition for the fascia webs of left girders on spans 1 & 2. Spans 1 & 4 have some paint failure mostly on the bottom flanges and below the joints.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D006924, LaBella Associates, P.C. conducted an asbestos sampling survey of the following bridges:

BIN 1-06468-9 Thompson Road over Interstate Route 690
BIN 1-05116-0 South Midler Avenue over Interstate Route 690
BIN 1-05111-9 Interstate Route 690 over Lodi Street
BIN 1-05084-0 On Ramp to Interstate Route 690 East Bound over Onondaga Creek
BIN 1-05082-1 Interstate Route 690 West Bound over Onondaga Creek
BIN 1-05082-2 Interstate Route 690 East Bound over Onondaga Creek
BIN 1-05100-0 Interstate Route 690 East Bound from Clinton St. to McBride St.
BIN 1-03167-1 Interstate Route 81 South Bound over Route 11
BIN 1-03160-0 Route 298 over Interstate Route 81
BIN 1-09551-0 Interstate Route 690 West Bound over Interstate Route 81

Based on laboratory analyses of bulk samples collected, the following materials were determined to contain asbestos:

BIN 1-06468-9 Thompson Road over Interstate Route 690

Type of Material	Estimated Amount
Sheet Packing	18.8 Square Meters

BIN 1-05116-0 South Midler Avenue over Interstate Route 690

Type of Material	Estimated Amount
Sheet Packing	11 Square Meters
Tar Paper Pipe Wrap	63.4 Linear Meters

BIN 1-05111-9 Interstate Route 690 over Lodi Street

Type of Material	Estimated Amount
Sheet Packing	30.8 Square Meters
Caulking Compound	8 Linear Meters

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structures were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structures, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structures. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. Drawings of the structures at the Site were created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridges or the approaches to the bridges were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in FIGURES 2-8. Results of bulk sample analyses are tabulated in TABLE 1.

IV. Results

Based on the analytical results, the following materials were determined to be asbestos-containing:

A. **BIN 1-06468-9 Thompson Road over Interstate Route 690**

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slabs at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations on both ends of the bridge.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 18.8 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

B. **BIN 1-05116-0 South Midler Avenue over Interstate Route 690**

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slabs at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations on both ends of the bridge.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 11 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 3.

Tar Paper PipeWrap

Asbestos-containing tar paper pipe wrap is located on the water line suspended below the west side of the bridge.

It is estimated that the total amount of this asbestos-containing tar paper pipe wrap on the bridge is approximately 63.4 linear meters (full length of the bridge). This estimate is based on field measurements taken at the time of the site visit. The approximate location of this asbestos-containing tar paper pipe wrap is shown in FIGURE 3.

C. **BIN 1-05111-9 Interstate Route 690 over Lodi Street**

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slabs at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations on both ends of the bridge.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 30.8 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 4.

Caulking Compound

Asbestos-containing caulking compound is located in scattered areas around the perimeter of some of the guide rail base plates on both the north and south sides of the bridge. Observations made at the time of the site visit revealed that much of this material has apparently been eroded away over the years, leaving only an estimated 20% of the original caulking remaining in place around the base plates.

Based on 20% of the original caulk remaining, it is estimated that the total amount of this asbestos-containing caulking compound on the bridge is approximately 8 linear meters.

DATE: MARCH 18, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051160 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1051160 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1051160 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has **not** been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 2, Interior Girders S18 to S22, End of Bottom Flange Cover Plate	58.34	427.96
Span 2, Interior Girder S23, End of Bottom Flange Cover Plate	82.13	545.04
Span 3, Interior Girders S10 to S14, End of Bottom Flange Cover Plate	39.04	333.02
Span 3, Interior Girder S15, End of Bottom Flange Cover Plate	49.99	386.90
Span 4, Interior Girders S2 to S6, End of Bottom Flange Cover Plate	137.88	819.38

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 4, Interior Girder S7, End of Bottom Flange Cover Plate	135.78	809.06

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

There were no delaminated concrete deck areas (0%) on this bridge. Due to the high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC+30). This option does not the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8” with 2” of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the additional 1 ½” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing sidewalk and curb with 4-rail bridge railing and pedestrian fence will be removed and replaced with a new sidewalk and curb with vertical faced bridge concrete barrier and pedestrian fence attached to the top of the barrier and the 2-rail bridge railing with curb will be removed and replaced with new single-slope concrete bridge barrier. The existing approach slabs will receive the same treatment as the deck. The existing bridge joints will be replaced with new elastomeric bridge joints and

seals. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.975 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete demolition of the existing bridge deck, sidewalk and curbs, 4-rail bridge railing and 2-rail bridge railing, and bridge deck joints. The bridge deck will be replaced with a new deck, sidewalk with curb and vertical faced concrete barrier with pedestrian fence on top of the barrier along the east side of the bridge and single-slope barrier along the west side of the bridge and new armorless bridge joints. The approach slabs would also be replaced under this option. The new bridge deck would be 9 ½" standard thickness as compared to the 8" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 1.33 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options, however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

BIN 1053931

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, deck joint replacement. The last major rehabilitation of the structure occurred in 2002 under contact D259039 which included bearing replacement and miscellaneous substructure repair. The steel was painted under contract D261472 in 2010.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements seemed to be in good condition. The elastomeric pads were intact and clean. Bearings were replaced in 2002 under contract D259039. Bearing sole plates contained some rust due to leaking bridge joints.

Substructure

West Abutment – The concrete backwall contained one area of delaminated concrete and cracking above pedestal 1. The stem and pedestals appeared to be in good condition. The wingwalls exhibited minor map-cracking and rust-staining.

Pier 1 – The concrete in pier 1 was typically in good condition. The concrete showed signs of staining from water leaking through the deck joints. The pedestals exhibited similar condition to the columns and cap beam. Some debris was discovered on the cap beam between pedestals 4 and 5. Further

investigation revealed the deck joint above contained severe spalling, exposed reinforcing and leaking joint seals.

Pier 2 – The concrete columns were typically in good condition with only minor isolated areas of delaminated concrete. Pedestal 1 contained delaminated concrete on the east face. The cap beam had areas of delaminated concrete under pedestals 1, 2, 3, and 6 on the east face and under pedestals 1, 4, and 5 on the west face. The concrete showed signs of staining from water leaking through the deck joints.

East Abutment – The concrete appeared to be in good condition but did contain isolated areas of rust staining. The wingwalls exhibited minor map-cracking and rust-staining.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1053931

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details:

100% hands on inspection of cover plate welds performed – no cracks found.

Overall Steel Condition:

Generally, the steel appeared to be in good condition. The bridge was recently painted in 2010 and seemed to be functioning for the majority of the structure. The steel showed signs of deterioration at the bearings due to leaking bridge deck joints. Steel repairs were noted on Girder 1 at the end of span 2 and beginning of span 3. The repair consisted of ¾" plate welded directly to the web to locally increase the web section thickness. Further investigation revealed the bridge deck joints are leaking above this repair and have started to corrode the existing repair. The paint condition of the repair indicates the repair was made after the structural steel painting in 2010. Structural flag documentation corroborates this observation.

Paint:

The paint is in typically good condition however, minor rust scale has formed on the diaphragms and girders under leaking bridge deck joints. The bridge was painted in 2010 under contract D261472. The area of the steel repair on Girder 1 contained the most significant paint deterioration on the structure.

Section Loss:

The 2012 Level 2 Load Rating showed 10% blanket section loss in the web of girder 1. This should be maintained in future ratings.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 5, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1053931 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1053931 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments and piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 5, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1053931 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Internal Girder fatigue components for all spans have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
All Spans, Exterior Girders, End of Bottom Flange Cover Plate	Infinite	Infinite
All Spans, Interior Girders, End of Bottom Flange Cover Plate	-19.84	12.33

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

This bridge deck does not have any (0%) delaminated deck areas. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¾" with nearly 4" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing parapet and safety walk on the outsides of this bridge will be removed and replaced with single-slope concrete barrier. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.534 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, bridge deck joints, and parapet walls down to the existing steel girders. The bridge deck would be replaced with a new concrete deck, single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¾" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.638 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1053932

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, and deck joint replacement. The last major rehabilitation of the structure occurred in 2002 under contact D259039 which included bearing replacement and miscellaneous substructure repair. The steel was painted under contract D261472 in 2010.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements seemed to be in good condition. The elastomeric pads were intact and clean. Visual inspection indicated a corner of the bearing base plate hangs over the strip edge of the pier cap on both piers.

Substructure

West Abutment – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The concrete backwall contained areas of delaminated concrete near pedestals 5 and 6. Rust stains were evident on the backwall between pedestals 2 to 5. Efflorescence was along a previous repair between pedestals 4 and 5. The wingwalls contained only minor isolated areas of delaminated concrete and cracking.

Pier 1 – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The cap beam had areas of delaminated concrete near pedestal 2 on the east face and near pedestals 1 and 4 on the

west face. Columns 1, 2, and 4 had areas of delaminated concrete towards the top of the columns. The metal gutter and hangers above the pier were rusted through.

Pier 2 – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The cap beam contained areas of delaminated concrete below pedestal 6 on the east face and below pedestals 1, 2, and 6 on the west face. Columns 1, 2, and 3 had areas of delaminated concrete towards the cap beam. The metal gutter and hangers above the pier were rusted through.

East Abutment – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The concrete backwall had an area of delamination above the pedestals from pedestals 1 to 4, with spalled concrete behind pedestal 1, and a section of spalled and delaminated concrete by pedestal 6. Rust stains and cracking were throughout the entire backwall. The cheekwall by pedestal 1 had a section of delaminated concrete. The wingwalls contained only minor isolated areas of delaminated concrete and cracking.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1053931

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

100% hands on inspection of cover plate welds performed – no cracks found.

Overall Steel Condition

Generally, the steel appeared to be in good condition. The bridge was recently painted in 2010 and seemed to be functioning for the majority of the structure. Over Pier 1 and Pier 2 in the first bay near pedestal 2 the diaphragms have section loss to the web and bottom flange next to the drain. On Span 2 the first girder has numerous impact locations.

Paint

The paint is in typically good condition however, minor rust scale has formed on diaphragms and girders under leaking bridge deck joints. The bridge was painted in 2010 under contract D261472.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 5, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1053932 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1053932 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments and piers. Seat width improvements are required at the begin abutment. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 4, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1053932 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Interior Girder fatigue components for all spans have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girder G7, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 1, Interior Girders, End of Bottom Flange Cover Plate	-21.56	3.88
Span 1, Exterior Girder G9, End of Bottom Flange Cover Plate	81.94	513.16
Span 2, Exterior Girder G10, End of Bottom Flange Cover Plate	39.10	302.35
Span 2, Interior Girders, End of Bottom Flange Cover Plate	-21.56	3.88

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 2, Exterior Girder G12, End of Bottom Flange Cover Plate	41.46	313.97
Span 3, Exterior Girder G13, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 3, Interior Girders, End of Bottom Flange Cover Plate	-18.54	18.74
Span 3, Exterior Girder G15, End of Bottom Flange Cover Plate	Infinite	Infinite

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 28% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¾" with nearly 4" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing parapet wall and safety walk will be removed and replaced with single-slope concrete barrier. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.650 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, bridge deck joints, and parapet walls down to the existing steel girders. The bridge deck would be replaced with a new concrete deck, single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¾" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.776 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1053941

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation project, miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, and deck joint replacement.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have rust scale, with the fascia bearings exhibiting heavy rust.

Substructure

West Abutment – The concrete backwall and pedestals contained minor isolated areas of delaminated concrete and cracking. The concrete stem beneath pedestals 1 and 2 had sections of delaminated concrete. There were heavy salt stains on the backwall, cheekwall, and bearing seats. The wingwall had minor surface and map cracks, with salt staining present.

East Abutment – The concrete backwall, stem, and pedestals contained minor isolated areas of delaminated concrete and cracking. The stem exhibited one section of delaminated concrete below pedestal 1. The backwall above pedestal 1 contained a patch that had started to spall. There were heavy salt and rust stains on the backwall, cheeckwall, and bearing seats. The Northeast cheekwall and wingwall had map cracking with salt stains along several crack lines with

salt and rust stains from the parapet joint. The joint material in the mid-wall appeared dry rotted and cracked.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1053941

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Cover plate welds: 100% Hands-on inspection performed.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

The paint is in good overall condition with minor rusting and flaking along the edges of the girder flanges.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E.**
NYSPE 084915

DATE: **FEBRUARY 5, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1053941 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1053941 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL F. BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 3, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1053941 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Interior Girder fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders G1, End of Bottom Flange Cover Plate	Infinite	Infinite
Span1, Interior Girders, G2 End of Bottom Flange Cover Plate	-11.67	49.94

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 16% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 8” with 2” concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 1 ½” of concrete to provide the standard 9 ½” bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3” of concrete cover. The existing vertical faced parapet with safety walk and curb along both sides of the bridge will be removed and replaced with single-slope concrete barrier. The existing original armor bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.295 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete demolition of the existing bridge deck, parapet walls and curbs, and original bridge deck joints. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 8" of existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.341 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

BIN 1053942

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation, miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, and deck joint replacement.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – Bridge Deck Evaluation not required. The Bridge Deck rating from 2012 is less than 5.

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have rust scale and pack rust.

Substructure

West Abutment – The concrete backwall, pedestals, and stem contained only minor isolated areas of delaminated concrete and cracking. There were salt stains on the cheekwall and bearing seats. The backwall had heavy salt stains along the entire length and rust stains behind pedestal 12. The southwest wingwall had minor map cracking with salt and rust staining present. The material in both midwall joints appeared dry rotted and cracked.

East Abutment – The concrete backwall and stem contained minor isolated areas of delaminated concrete and cracking. Pedestals 13 and 14 exhibited horizontal cracks on the north and west faces. There were heavy salt stains on the backwall and bearing seats. Rust stains were evident behind pedestal 9. The southeast wingwall had map cracking and rust staining, mostly below the cheekwall.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1053942

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Cover plate welds: 100% Hands-on inspection performed.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

The paint is in good overall condition with minor rusting and flaking along the edges.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E**
NYSPE 084915

DATE: **FEBRUARY 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1053942 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1053942 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL F. BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 3, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1053942 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Interior Girder fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders G3, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 1, Interior Girders G4, End of Bottom Flange Cover Plate	-13.94	38.74

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1053969

Visual Inspection

The bridge was built in 1968 with a major rehabilitation in 1984. During the 1984 rehabilitation miscellaneous concrete repairs were made to the abutments and piers under contract D500057. Superstructure repairs included painting structural steel, concrete bridge deck overlay, and deck joint replacement. Miscellaneous joint repairs were made to the deck and approach slabs in 1995 under contract D256745.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have rust scale, with the outer bearings typically exhibiting heavier rust.

Substructure

West Abutment – The concrete backwall and stem contained minor isolated areas of delaminated concrete and cracking. Pedestal locations 14 and 16 exhibited delamination and spalling. Pedestal 6 had moisture staining and full height cracks in the stem and backwall on either side. The backwall in between pedestals 8 and 9 showed moisture and there is a full height crack behind pedestal 9 in the stem and backwall. The southwest wingwall contained an 8’ long crack and the northwest wingwall had a section of delaminated concrete in the upper section.

East Abutment – The concrete backwall and pedestals contained minor isolated areas of delaminated concrete and cracking throughout the wall. The stem exhibited delaminated concrete, mostly on the upper section, below

pedestals 1 to 6 and 15 to 16. The backwall between pedestals 8 and 9 had moisture staining. The wingwalls both contained minor isolated areas of delaminated concrete and cracking.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1053969

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Cover plate welds: 100% hands-on inspection performed.

Overall Steel Condition

The bottom flanges of the fascia girders have widespread rust and delaminated paint with isolated pockets of rust and section loss.

Paint

The paint along several of the lower flange sides of the girders and along the right web of girder 16 was cracked and flaking off.

Section Loss

The web of girder 16 was checked in two locations. At 7.5' from the west end the web thickness was measured at 0.55" and the bottom flange at 0.75". In the east corner the web was measured at 0.25".

Due to the age of the steel, a blanket 5% section loss should be used on the bottom flange and lower 6 inches of the web of the fascia girder in load rating. The interior girders should be evaluated with 5% section loss of the bottom flange.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 5, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1053969 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1053969 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 4, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1053969 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the interior fatigue components and the exterior fatigue components at G8 and G9 have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders G1 and G16, End of Bottom Flange Cover Plate	Infinite	Infinite
Span 1, Interior Girders G2, G3, G12 to G15, End of Bottom Flange Cover Plate	-28.66	25.96
Span 1, Interior Girders G4 to G7, End of Bottom Flange Cover Plate	-30.10	18.89
Span 1, Exterior Girder G8, End of Bottom Flange Cover Plate	-23.84	49.67

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girder G9, End of Bottom Flange Cover Plate	-20.99	63.72
Span 1, Interior Girders G10 and G11, End of Bottom Flange Cover Plate	-28.11	28.68

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 34% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¾" with nearly 4" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing non-conforming parapet walls, curbs and railing will be removed and replaced with single-slope concrete barrier. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.658 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, bridge deck joints, single-slope barrier along the median and the parapet walls down to the existing steel girders. The bridge deck would be replaced with a new concrete deck, single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¾" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.754 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1064650

Visual Inspection

The bridge was built in 1971 under contract F.I.S.H. 68-4. The bridge deck spot repairs were performed in 1980 under contract D95879. Bridge deck joints were replaced in 2002 under contract D259214.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements were newly painted since the 2012 biennial inspection. Bearings typically contained pack rust and did not appear to be functioning as intended.

Substructure

West Abutment – Concrete backwall contained widespread cracking across the entire length and a small spall on the upper left corner above pedestal 1. The stem appeared in good condition with no distressed areas. The deck joint above the abutment appeared to be leaking on the right side above pedestal 5.

Pier – Cap beam contained isolated areas of delaminated concrete. The pedestals contained cracks and spalls.

East Abutment – Concrete back wall contained widespread cracking across the entire length with a spall above pedestal 5. There was salt and ice accumulation on the back wall above pedestal 1. The abutment stem appeared to be generally in good condition with an area of delaminated concrete below pedestal 5.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1064650

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

100% hands-on inspection performed of gusset plate welds; no cracks were found.

Overall Steel Condition

The steel showed some signs of previous deterioration. Relatively new bridge paint on the fascia girders and all girders in the vicinity of the bearings indicates the steel is not actively deteriorating on a large scale. There were isolated pockets of delaminated paint and rust on the cross frame members. This paint appeared to be older than the paint on the fascia girders. Also, some isolated areas of delaminated paint existed on the interior girders.

Paint

Exterior girders and areas in the vicinity of the bearings were painted since the 2012 biennial bridge inspection. The interior girders appeared to be spot-painted. The newly painted areas appeared to be in good condition.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating of the girders

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Kinne Road Bridge over Interstate Route I-481. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1064650 – Kinne Road over Interstate Route I-481

Type of Material	Estimated Amount
Sheet Packing	7.4 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Kinne Road Bridge over Interstate Route I-481. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E**
NYSPE 084915

DATE: **FEBRUARY 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1064650 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1064650 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **MARCH 12, 2015**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1064650 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girder G1 (Right), Gusset Plate at Bot. Flange, Midspan	286	1547
Span 1, Interior Girder G2 (Right), Gusset Plate at Bot. Flange, Midspan	973	4930
Span 1, Interior Girder G2 (Center), Gusset Plate at Bot. Flange, Midspan	1423	7144
Span 1, Interior Girder G2 (Left), Gusset Plate at Bot. Flange, Midspan	1012	5120
Span 1, Exterior Girder G1 (Left), Gusset Plate at Bot. Flange, Midspan	421	2213

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 2, Exterior Girder G3 (Right), Gusset Plate at Bot. Flange, Midspan	270	1470
Span 2, Interior Girder G4 (Right), Gusset Plate at Bot. Flange, Midspan	864	4390
Span 2, Interior Girder G4 (Center), Gusset Plate at Bot. Flange, Midspan	1196	6027
Span 2, Interior Girder G4 (Left), Gusset Plate at Bot. Flange, Midspan	939	4763
Span 2, Exterior Girder G3 (Left), Gusset Plate at Bot. Flange, Midspan	442	2316

E. Recommendations

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 74% of the total deck area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing 2-rail bridge railing and curb will be removed and replaced with single-slope concrete barrier on the south side of the bridge. The existing 4-rail bridge railing, sidewalk and curb will be replaced with new sidewalk, curb and vertical-faced concrete parapet along the north side of the bridge. The existing pedestrian fence will be removed and replaced along the bridge. The existing elastomeric bridge joints will be replaced with new

armorless bridge joints. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.663 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the bridge deck, elastomeric bridge deck joints, sidewalk with curb on the north side of the bridge, and 2-rail and 4-rail bridge rail with pedestrian fencing along both sides of the bridge. The bridge deck would be replaced with a new concrete deck, new sidewalk and curb with vertical faced parapet concrete barrier and pedestrian fencing on the north side of the bridge and single-slope concrete barrier and pedestrian fencing on top of the barrier on the south side of the bridge and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.807 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1064689

Visual Inspection

The bridge was constructed in 1971. Miscellaneous concrete repairs to the abutments and piers, a high density deck overlay, an armored joint system, and miscellaneous structural steel repairs were made in 1979 under contract D95879. In 1997 miscellaneous concrete repairs to the abutments and piers and armored joints were installed under contract D257576. Under contract D258737 in 2001 various girders were heat straightened, web cracks were repaired, and bent diaphragms were removed and replaced.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have moderate rust with the fascia bearings typically having heavy rust.

Substructure

South Abutment – The concrete backwall contained minor isolated areas of delamination and cracking. The median joint between pedestals 6 and 7 on the backwall contained efflorescence. The stem contained cracks near pedestals 1 to 4 and 11 to 12, and a section of delaminated concrete between pedestals 4 and 5. Pedestals 2 and 8 displayed delaminated concrete and pedestal 4 had a crack on the east face. The east cheekwall was spalling next to pedestal 12. The southwest and southeast wingwalls contained sections of delaminated and spalling concrete.

Pier 1 – A majority of the pedestals contained areas of delaminated and spalling concrete with exposed rebar. On the cap beam above columns 1 and 2 areas of

delaminated concrete were observed. Columns 1 and 4 had delamination of the south faces and columns 1, 2, and 3 contained delamination of the west faces. Column 4 had delamination on the east face.

Pier 2 – Pedestals 1, 2, and 6 to 12 contained sections of delaminated or spalling concrete. The cap beam contained delamination on the south face beneath pedestals 1, 2, 4, and 7 to 9. The north face of the cap beam had delamination below pedestals 3, 7, and 11. The bottom face was delaminated between columns 1 and 2. All four columns had delamination on the south face, with columns 2 and 3 exhibiting delamination on the west face and columns 2 and 4 on the east face. Column 2 had a section of spall on the north face.

Pier 3 – Pedestals 1, 7, and 12 displayed areas of delaminated and spalling concrete. The cap beam had sections of delamination above columns 1, 2, and 3 on the south face and below pedestal 12 on the south and bottom faces. The cap beam also had areas of delamination above columns 1 and 2 on the north face and on the bottom face below pedestal 1. Columns 1 and 2 had delamination on the south, east, and north faces near the cap beam. Column 3 had an area of spall near the cap beam on the south face.

North Abutment – The concrete stem contained areas of delamination below pedestals 10 and 12 and map cracking near the median joint between pedestals 6 and 7. Pedestals 1 and 3 had sections of delamination. The backwall had severe sections of spall with exposed rebar behind pedestals 1 and 12. Delamination was observed from pedestals 1 to 4, and map cracking around the median joint between pedestals 6 and 7. The northeast and northwest wingwalls both contained map cracking with efflorescence.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1064689

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – No

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – Yes

Special Emphasis Details

Staggered diaphragms on all spans were 100% hands on inspected. No defects were observed.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed. Surface rust was present along the bottom flanges and lower sections of the webs in all spans.

Paint

The paint was observed to be blistering and peeling in several locations, especially in the lower sections and bottom flanges of the steel.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 17, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1064689 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1064689 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E.**
NYSPE 084915

DATE: **JUNE 16, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1064689 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The fatigue-prone detail is plate girders with thin webs (< 0.4") and staggered diaphragms. Cracks can form in the web adjacent to the connection plate snipe due to out of plane bending. This detail was made a special emphasis detail during inspection requiring 100% hands-on inspection by NYSDOT inspection technical advisory INSP 02-001, dated August 28, 2008.

During the in-depth inspection a 100% hands-on inspection of the fatigue-prone detail was performed and no issues were found, see attached Structural Steel Inspection Summary from the In-Depth Inspection Report.

The detail is considered an AASHTO Category B fatigue-prone detail, therefore no fatigue evaluation was performed on this detail.

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 10% in the northbound direction and 22% in the southbound direction of the total deck area. Due to the age, condition and the overall high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life of this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 7 ½" with 1 ½" cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of 2" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing 2-rail bridge railing and curbing will be removed and replaced with single-slope concrete bridge barrier. The existing armor bridge joints will be removed and replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 2.67 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete demolition of the existing bridge deck, 2-rail bridge railing and curb, and armor bridge joints. The bridge deck would be replaced with a new concrete deck, new single slope concrete median barrier, and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the existing thickness of 7 ½". The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $3.22 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1064691

Visual Inspection

Rehabilitation plans show a complete deck scarification with concrete overlay and joint replacement under contract D95879 (no date on plans but were signed 5/78). Contract D256745 (7/95) installed new armored joint system with compression seals, however, the West (Begin) Abutment received a poured construction joint instead, per hand written notes on the record plans and verified by our the field investigation. There are fixed bearings at the West Abutment.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report.

Steel – See Structural Steel Inspection Summary.

Bearings – Bearings are original. The expansion type slide over a bronze plate. Bearings (fixed) on the beginning abutment have some paint loss with associated rusting, fascias in worst condition. Pier bearings have heavy build up of paint chips and pack rust debris with some delamination of the steel. Expansion bearings appear frozen in place. Fascia bearings (expansion) on the end abutment have some paint loss with associated rusting. Interior bearings appear in satisfactory condition.

Substructure

West Abutment (Begin) – Beginning left cheek wall has a spall in the top front corner of 6” height (H) by 12” width (W) by 4” depth (D) with horizontal cracking across front face also at the pedestal height. The backwall has map cracking with efflorescence bleeding above pedestal 1 and over to pedestal 2. The backwall also has light hollowness above pedestal 5, 18” W by 18” H, and between pedestals 9 & 10, 12” W by 12” H. Pedestal 1 has vertical map cracking on right side (facing) of front face. Pedestals 3-5 have short horizontal cracks

near the top of the front face (facing) bleeding rust stains. The right fascia pedestal 10 has a 24” W by 12” H by 6” D area which is spalling and cracking which wraps around the corner and extends into the right face (left-facing) for 6”.

Pier - Column 1 has some delamination in beginning top left corner that wraps around to the left (north) face 3.5’ H by 0.5’ W on either face. Column 2 is in good condition. The left capbeam over columns 1 & 2 is basically sound with one 1’ W by 1’ H delamination on the beginning face below pedestal 2 and one 2’ W by 2’ H delamination on the end face below pedestal 5. Pedestal 1 is completely spalled and cracked on all four faces to 4” deep with some (+/-5%) loss of bearing area for the span 2 bearing. Pedestal 2 is cracked and spalled for the left ¾ of the begin face with hollowness on the left face. Pedestal 3 is in good condition. Pedestal 4 has some light hollowness on the right side of the beginning face. Pedestal 5 is in good condition.
Column 3 has some delamination in begin top right corner that wraps around to the right (south) face 4.0’ H by 1.0’ W on either face. Column 4 has some delamination in beginning top left corner that wraps around to the left (north) face 1.5’ H by 1.0’ W on either face. The right face (south) is spalled to 2” deep or delaminated for the bottom 5’; full width. Additionally, there is a hairline vertical crack from the spalled area to the top of the column 6” from the end face. The right capbeam over columns 3 & 4 has longitudinal cracking between the two columns 6” from the bottom edge on the begin, bottom and end faces. Also 6” from the top (begin) between peds 7 & 8. The concrete around the cracks is heavily delaminated with some spalls. All pedestals have some deterioration. #6 & #7 have map cracking on the begin faces. #8, #9, & #10 have horizontal cracking with associated delamination on the begin, left and end faces; begin, left, and right faces; all four faces, respectively.

East Abutment (End) – The end left cheek wall has light hollowness on the left fascia face in top front corner, 4’ H by 1’ W. There is concentrated map cracking with efflorescence bleeding in backwall behind pedestal 1. Backwall also has

rust stains to the right of pedestals 2 & 3 and behind pedestal 10. A localized spall was found in backwall above pedestal 10, 12” W by 3” D by full height, with horizontal cracking projecting into the right retaining wall from the top of the pedestal. Pedestal 10 has a hairline crack with rust staining in the top left front corner.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1064691

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Fatigue prone partial length cover plate weld ends on all girders on both spans appear in satisfactory condition. 100% hands-on inspection performed of fatigue-prone welds; no cracks were found.

Overall Steel Condition

Girders and cross members are in satisfactory condition with the exception of section loss to steel below the pier joint as detailed below.

Paint

Paint is peeling and blistering on all lower flanges of girders with areas over traffic and fascia girders in worst condition. This condition occurs in spot locations on other parts of the girders. Concentrated paint loss below the pier joint has allowed section loss to occur.

Section Loss

Heavy seepage through the pier joint has led to nominal losses (<5%) in the steel directly below, however, slightly more section loss has occurred in the left (north) fascia girders of both spans at the pier to +/-10% for full height of their webs for a width of 3” at the very ends of the girders. A field measurement of 5.5” from the end of the girder to the centerline of the bearing shows all loss behind the bearings. Due to the age of the steel a blanket 5% section loss should also be used in load rating.

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1064691 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1064691 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 13, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1064691 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Span 1 Exterior fatigue components have been **exhausted** and the remaining safe fatigue life of the Span 1 Interior and Span 2 Exterior fatigue components are nearing exhaustion.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders, End of Bottom Flange Cover Plate	-9.58	55.66
Span 1, Interior Girders, End of Bottom Flange Cover Plate	2.48	114.98
Span 2, Exterior Girders, End of Bottom Flange Cover Plate	9.87	151.37
Span 2, Interior Girders, End of Bottom Flange Cover Plate	34.44	272.25

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 13% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard of 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" cover of concrete. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing armor bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost for this option is $ 0.723 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, 2-rail bridge railing, and armor bridge joints. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $0.981 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1064692

- **In-Depth Condition:**

Visual Inspection: Rehabilitation plans show a complete deck scarification with concrete overlay and joint replacement under contract D95879 (no date on plans but were signed 5/78). Contract D256745 (7/95) installed new armored joint system with compression seals, however, the West (Begin) Abutment received a poured construction joint instead, per hand written notes on the record plans and verified by our the field investigation. There are fixed bearings at the West Abutment.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** See Bridge Deck Evaluation Report.
- **Steel –** See Structural Steel Inspection Summary.
- **Bearings –** Bearings are original. The expansion type slide over a bronze plate. Bearings (fixed) on the beginning abutment have some paint loss with associated rusting, fascias in worst condition. Pier bearings have heavy build up of paint chips and pack rust debris with some delamination of the steel. Expansion bearings appear frozen in place. Fascia bearings (expansion) on the end abutment have some paint loss with associated rusting. Interior bearings appear in satisfactory condition.

Substructure

- **West Abutment (Begin) –** The beginning left retaining wall is generally in good condition except for a 12” by 12” area of map cracking at mid height on the left. The backwall has heavy stains from road splash/snow melt for full height by 12” W in beginning left corner (right side-facing). Some map cracking at the top of this staining. The

compression seal above obviously leaks as seen by the extensive staining across the width of the backwall. The staining has progressed to extensive map cracking with efflorescence seepage and punky concrete for full height at the far right pedestals and some spalling to 3" D in the top right (left-facing) corner of the backwall. Pedestal 1 (11 from plans) has map cracking with efflorescence seepage on the left (north) and right (south) faces and a full height stain with minor cracking at the top on the front (facing) face. A few minor cracks with some staining on pedestal 10. The right cheek wall and embankment wall behind the cheek wall has several localized spalls to 3" deep. The vertical faces have scattered mapcracking with punky concrete.

- **Pier –** Column 1 (column 5 from original contract plans) on the begin (south) face has for the top 8' by 2' W is delaminated which wraps around to the left (north) face where a +/-1/8" W vertical crack from the top down is 6' L with 6" delaminated concrete on either side. The end (east) face from the top down has a 3.5' L by 1/8" W vertical crack. Column 2 has some delamination from the top down on the begin face (west) 2.5' H by 1' W at the top left corner which wraps around to the left (north) face for 1'. Additionally, on the left face in the other top corner there is delamination at 6" W by 24" L which wraps around to the end (east) face for 12". The delamination on the left column (1) on the begin face extends into the left capbeam (over columns 1 & 2) for 2' H by 3' W. The capbeam also has delamination directly below pedestal 1 on the same face for 18" W by full height of capbeam and below this on the bottom face there is delamination for an area of 2' by 2'. On the end (east) face there is a single 12" by 12" minor spall below pedestal 2. The entire right (south) face is either spalled, map cracked or delaminated. Pedestal 1 (pedestal 11 from original contract plans) has extensive cracking with some hollowness

on both side faces (south & north) and pedestal 2 has a 12” by 12” by 2” D spall on the end face. Column 3 (column 7 from original contract plans) has some minor spalling in top right corner of begin (west) face 12” H by 18” W which wraps around the corner to the right (south) face for 6”. Column 4 has light delamination on the begin (west) face in bottom left 12” by 6” W and top center 24” by 24”. The end and right faces have vertical hairline cracking in their adjoining corner from the top down for 6’ L and for 18” W the concrete is delaminated. On the end (east) at mid height there is an intersecting horizontal crack for 18 “ long. At the intersection of the cracks there is spalling to 2” D by 6” W by 12” H. The right capbeam over columns 3 and 4 has some delamination on begin (west) face in top left corner 18” by 18”, spalling to 2” D by 18” W by 12” H directly over column 3’s right side, cracking and spalling in bottom corner just left of center line of capbeam for 6” H by 2.5’ L which extends for 6” into bottom face of capbeam, and delamination over column 4 for 6” H by 2.5’ W. The end (east) face on the bottom corner for 6” H below pedestal 7 & 8 is cracked and delaminated for 48” L which extends under to the bottom face for 6”. The right (south) face is completely map cracked through-out. Pedestal 8 has horizontal cracking with hollow concrete on begin, left, and right faces and map cracking through-out on the end (east) face.

- **East Abutment (End) –** The end left retaining wall has minor map cracking with efflorescence bleeding at top of fascia pedestal and below. The backwall has a localized area of spalling and punky concrete, 1’ H by 3’ W, just below the deck and against the left retaining wall. The backwall also has full height water stains between pedestals 1 & 2; and rust stains to right of pedestal 2 and between pedestals 9 & 10. There is extensive map cracks with bleeding efflorescence behind pedestal 10 over to the cheekwall. The end right

cheekwall has map cracking and a minor 2” D spall in the top 18” on the front face (begin) and full height spalling to 3” D, cracking, and punky concrete on the back face (end) which extends across the right face (south) for 12”. For the retaining wall behind the cheek wall there is complete map cracking, punky concrete, and spalling to 3” D for that portion that can be seen.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1064692

Special Emphasis Inspection Required
Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – Yes
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details: Partial length coverplate weld ends on all girders on both spans appear in satisfactory condition.

Overall Steel Condition: There is advanced section loss to the fascia girders below the pier joint as detailed below, however, other areas of the girders and cross members are in satisfactory condition.

Paint: Paint is peeling and blistering on all lower flanges of girders with areas over traffic and fascia girders in worst condition. This condition occurs in spot locations on other parts of the girders. Concentrated paint loss below the pier joint has allowed advanced section loss to occur.

Section Loss: Heavy seepage through the pier joint has led to nominal losses (<5%) in the steel directly below, however, more advanced section loss has occurred in the beginning of the left (north) fascia girder (G-1) web of span 2 at the pier to +/-10% for an area of 6" H by 22" L just above the bottom flange. A field measurement shows that the end of the girder to the centerline of the bearing is 5.5", therefore, approximately 16.5" of the loss occurs after the centerline of the bearing. The same condition is occurring in the same location on the right (south) fascia girder (G-10) of span 2 also. Here, the section loss as measured by a 'D' meter indicates the loss to be in the range of 55% for the web in an area of 5.5" H by 16" L. This would translate into 10.5" of loss after the centerline of the bearing. Additionally, the loss for the adjoining connection plate for the cross bracing indicated 30% loss.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 21, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1064692 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1064692 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 13, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1064692 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the Span 1 exterior fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Exterior Girders, End of Bottom Flange Cover Plate	-8.00	63.42
Span 1, Interior Girders, End of Bottom Flange Cover Plate	5.19	128.35
Span 2, Exterior Girders, End of Bottom Flange Cover Plate	13.29	168.19
Span 2, Interior Girders, End of Bottom Flange Cover Plate	40.18	300.51

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 24% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" cover of concrete. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing armor bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.723 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, 2-rail bridge railing, and armor bridge joints. The bridge deck will be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The new deck would be 9½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $0.981 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069090

- **In-Depth Condition:**

Visual Inspection: Miscellaneous concrete repairs were made to the abutments and piers in 2005 under contract D259742.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** See Bridge Deck Evaluation Report.
- **Steel –** See Structural Steel Inspection Summary.
- **Bearings –** All expansion bearings (spherical) appear in good working order, however, they are closer to the right keeper plate than the left. This is the inside side of the curved girder. There is some minor rust on a few fascia bearings. The fixed bearings (spherical - piers 2 & 4) also appear in good working order with minor rust buildup on them.

Substructure

- **West Abutment (Begin) –** Map cracking and moisture buildup behind pedestal 1. Some cracking with shallow spalling for 3' high between pedestals 2 & 3 in the backwall. Light delaminations in same area between pedestals 3 & 4. Thin full height crack behind pedestal 4. Right cheek wall is spalled to 6" deep at the top front face with hollowness on the outside wall 6" W by 4' H.

  Pier #1 – Pier is overall in good condition except for a single for 2' H by 3' W area on the beginning face which has a minor spall with swallow delamination around it.

  Pier #2 – Seepage from road splash on the low side (right) has led to staining of the concrete with a cracked fascia pedestal and spot areas of delaminations on the bottom side of the hammerhead capbeam.

Minor spalls with localized delaminations on pedestals 2,3, & 4 and just below on the capbeam on both faces.

Pier #3 – Pier #3 is the only pier with a joint and there is extensive map cracking with efflorescence build up on the pedestals, capbeam, and column. Some minor cracking with localized delamination below pedestal 4, beginning face, and on and below pedestal 2 & 3 on the end face.

Pier #4 – The pier is basically sound and solid.

East Abutment (End) – There is heavy staining with efflorescence build up which runs down the backwall over the pedestals and down the stem at pedestals 1,2, & 5. A single spall measuring 18" W by 18" H by 8" deep in top right corner of backwall. Mapcracking on abutment from pedestal 1 to pedestal 2 and between pedestals 3 & 4.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069090

Special Emphasis Inspection Required
Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – Yes
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details:
100% hands on inspection performed – no cracks found.

Overall Steel Condition:

Paint: Paint is peeling away along bottom flange edges of all girders, also the same problem with web faces and outside top of bottom flanges of fascia girders. Paint has completely failed below both bridge ends and pier #3 joints where considerable section loss is beginning to occur.

Section Loss:

For span #3 @ G-1 in the web behind the bearing stiffener there was a reading of 0.22" for a 0.375" plate for the 2013 Biennial inspection which equates to 40% for the bottom 12" which is satisfactory at this time. Our inspection also concludes that above the bottom 12" to 18" there is loss to 25% and above the 18" the loss is 10% for full height. The outside bearing stiffener in the same location, the 2013 Biennial inspection states a reading of 0.35" out of 1.5" plate thickness, however, a closer inspection of the plans indicate the thickness to be 1.0" for a loss of 65% loss for the bottom 6". For G-5 there is localized web loss before the bearing stiffener on the bottom for 5" high by 16" long of 25%.
For span #4 at the beginning, on the G-1 web before the bearing stiffener, the 2013 Biennial inspection indicates 75% loss for the bottom 12". Our inspection concludes above the 12" to 24" the web loss is 50% and above that an average loss of 10% is adequate.
For both spans #3 & #4 there is additional +/- 5% loss full height in webs of all girders behind the stiffeners below the pier #3 joint. Also, cross bracing in all bays have loss in the range of +/- 5% in all members of the cross bracing.
For span #5 the 2013 biennial inspection indicates web loss before the G-5 bearing stiffener at the bottom in an area of 12" wide by 12" high with a loss of 75%. Our inspection concludes the height can be increased to 14" with the 75% more than adequate at this time. In front of this loss a 6" high by 8' long, we say 10' boxed area has 45% web loss. Past the bearing stiffener in the web at the bottom there is a 1" by 3" hole and is knife thin around it. Above this hole we have 20% loss for full height of the web.
Spot localized losses throughout bridge particularly on fascia girders due to paint failure.

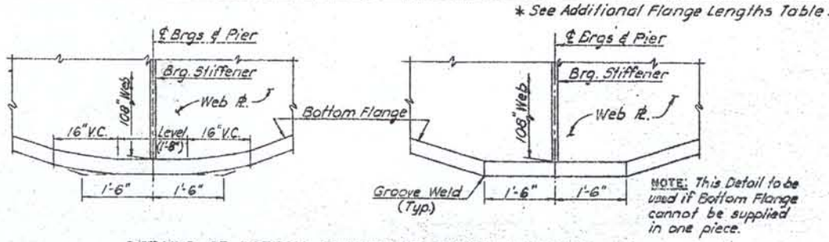
* See Additional Flange Lengths Table.



NOTE: This Detail to be used if Bottom Flange cannot be supplied in one piece.

DETAILS OF BOTTOM FLANGE AT GIRDER HAUNCHES
Scale: 3/4" = 1'-0"

NOTES:

THE CURVATURE SHOWN ON THE FLANGE, AS DETAILED, MAY BE OBTAINED BY BENDING THE FLANGE WHILE AT A TEMPERATURE OF BETWEEN 1000° F. AND 1200° F. HEATING SHALL BE PERFORMED IN ACCORDANCE WITH THE PROVISIONS OF THE NEW YORK STATE SPECIFICATION FOR HEAT-CURVING AND CAMBERING OF ROLLED BEAMS AND WELDED PLATE GIRDERS. APPROPRIATE ADJUSTMENT TO THE DEPTH OF THE WEB MUST BE MADE.

AFTER BENDING THE FLANGE TO THE REQUIRED CURVATURE, THE CONTRACTOR SHALL INSPECT ALL SURFACES NEAR THE BENDS FOR INDICATIONS OF CRACKING BY THE MAGNETIC PARTICLE METHOD. THE COST FOR THE MAGNETIC PARTICLE INSPECTION SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE STEEL.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **APRIL 10, 2015**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069090 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown on the following pages.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **JESSICA S. BAUER, P.E**
NYSPE 084915

DATE: **FEBRUARY 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **SEISMIC ASSESSMENT SUMMARY**
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: **1069090 Seismic Assessment**

This memorandum summarizes the seismic assessment conducted for BIN 1069090 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or piers. Seat width improvements are required at the Begin Abutment and Pier 3. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 6% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" cover of concrete. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will be rehabilitated by removing delaminated concrete and replacement with new concrete. The existing armorless bridge joints will be replaced with new armorless bridge joints. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 2.03 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, railing, bridge deck joints and approach slabs. The bridge deck will be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The approach slabs will also be replaced. The new bridge deck will be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. This option would provide a service life of 40 years to the bridge deck. The construction cost of Option 3 is $2.58 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069100

Visual Inspection

The bridge was originally built under contract D95042 (Nov. 1975). Under contract D96534 (Aug. 1980) there was some approach work done such as pavement restoration and guide railing. There were two painting contracts referred to in the BIN folder; D254816 (Oct. 1993) and D260795 (May, 2008).

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report.

Steel – See Structural Steel Inspection Summary.

Bearings – Bearing elements typically have minor rust scale.

Substructure

North Abutment – Concrete backwall contained minor isolated areas of delaminated concrete and cracking. All pedestal locations have only minor isolated cracking and delamination, however, concrete debris from repairs to the abutment was never removed and now rests across the bridge seat and pedestals. The northeast wingwall contained isolated areas of delaminated concrete with efflorescence.

North Pier (Concrete Cap Beam) – The North end of the cap beam contains an area of delaminated concrete and cracking. All pedestal locations appear to be in good condition with only minor isolated cracking and delamination. The two columns appear to be in good sound condition with only small areas containing isolated map-cracking and delamination.

South Pier (Steel Cap Beam) – The West concrete column of the pier has areas of delamination on the Southwest and Northwest corners. The steel cap-beam contained 6” square areas of surface rust which forced the paint to flake off the steel.

South Abutment – Concrete backwall contained areas of spalled concrete across the top and cracking throughout the wall. Concrete debris from the backwall and joint repairs has fallen around the bridge seat and pedestals below. All pedestal locations appear to be in good condition with only minor isolated cracking and delamination. The southwest wingwall contains areas of cracking with efflorescence in and adjacent to the cracks.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069100

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – Yes
Pin and Hangers – No
Fatigue-Prone Welds – Yes
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details

Steel cap beam: 100% hands-on inspection of the non-redundant element was performed. No significant deterioration was found.

Gusset plates are welded to bottom, tension flange of girders and are not exempt because of being curved girders. 100% hands-on inspection of fatigue prone details was performed. No cracks were found.

Overall Steel Condition

The overall general steel condition is good, however, there is some pitting in the fascia beams probably due to road splash and snow melt. The pitting is a little more concentrated at the ends of the bridge. The 5% loss for age of steel will more than cover loss due to pitting.

The steel capbeam was entered and thoroughly inspected from end to end. Minor surface rust was found in spot locations along the edges of welds. Higher concentrations of surface rust exist at each end of the pier cap due to moisture drip through the beveled corners of the transverse stiffeners.

Paint

The paint appears to be in good condition. The structure was painted in 2008 under contract D260795.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

GENERAL NOTES

The subsurface explorations shown hereon were made between April 26, 1968 and July 30, 1974 by the Regional Soils Section.

1) General soil and rock (where encountered) strata descriptions and indicated boundaries are based on an engineering interpretation of all available subsurface information by the Soil Mechanics Bureau and may not necessarily reflect the actual variation in subsurface conditions between borings and samples. Detailed data and field interpretations of conditions encountered in individual borings are shown on the subsurface exploration logs.

2) The observed water levels and/or conditions indicated on the subsurface profiles are as recorded at the time of exploration. These water levels and/or conditions may vary considerably, with time, according to the prevailing climate, rainfall or other factors and are otherwise dependent on the duration of and methods used in the explorations program.

3) Sound engineering judgment was exercised in preparing the subsurface information presented hereon. This information was prepared and is intended for State design and estimate purposes only. Its presentation on the plans or elsewhere is for the purpose of providing intended users with access to the same information available to the State. This subsurface information interpretation is presented in good faith and is not intended as a substitute for personal investigation, independent interpretations or judgment of the Contractor.

4) All structure details shown hereon are for illustrative purposes only and may not be indicative of the final design conditions shown in the contract plans.

5) Footing elevations shown are as indicated at the time of this drawing's preparation.

NOTE:
Any differences between the actual fabricated camber of the steel cap beam and the computed camber as tabulated on Dwg. No. 21 shall be taken up by adjusting dimensions A and B. Dimension A shall be adjusted by subtracting the over camber or adding the under camber. Dimension B shall be adjusted by adding the over camber or subtracting the under camber. Adjustments shall be made prior to welding the steel bearing seat for Span 2 and drilling the holes in the Box Girder Web for Span 3.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 12, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069100 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069100 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or piers. Seat width improvements are required at Pier 2. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: PAUL BYRNE, P.E.
NYSPE 055928

DATE: MARCH 10, 2015

C&S PROJECT NO.: 190.514.001

RE: NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069100 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the controlling span (Span 3) of the existing bridge are shown below.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 3, Girder G301 – Gusset Plate at Bottom Flange, Mid Span	93	562
Span 3, Girder G302 – Gusset Plate at Bottom Flange, Mid Span	176	971
Span 3, Girder G303 – Gusset Plate at Bottom Flange, Mid Span	324	1702
Span 3, Girder G304 – Gusset Plate at Bottom Flange, Mid Span	399	2071
Span 3, Girder G305 – Gusset Plate at Bottom Flange, Mid Span	395	2049
Span 3, Girder G306 – Gusset Plate at Bottom Flange, Mid Span	263	1399
Span 3, Girder G307 – Gusset Plate at Bottom Flange, Mid Span	57	384

FATIGUE EVALUATION OF EXISTING BRIDGE

Designed by: JSB 3/6/15
Checked by: PFB 3/10/15

Structure

BIN 1069100, Span 3, G301 (G7), Bottom Flange
Carried: I-81 SB to I-481 NB
Crossed: I-81

Design Code

The fatigue evaluation of the existing bridge is performed in accordance with the AASHTO Guide Specifications for Fatigue Evaluations of Existing Steel Bridges, 1990. This reference is referred to as "AASHTO Fatigue."

Template Instructions

Values highlighted green are values to be input by the user.

Blue note text gives instructions or commentary for the template.

Red italic text in parentheses gives commentary specific to this structure.

Infinite Remaining Safe Fatigue Life (AASHTO Fatigue 3.1)

$$Safe\_Fatigue\_Life := \begin{cases} \text{"Infinite"} & \text{if } R_s \cdot S_{rP} < S_{FL} \\ \text{"Finite"} & \text{otherwise} \end{cases} = \text{"Finite"}$$

Finite Remaining Safe Fatigue Life (AASHTO Fatigue 3.2 - Alternative 1)

Present Age of Bridge: $Y_P := 2014 - y_b = 34.00$

Ratio of Fatigue Truck Weight for Past Period to Gross Weight of Fatigue Truck: $Ratio_{Wp\_W} := 1$

Ratio of Fatigue Truck Weight for Future Remaining Life Period to Gross Weight of Fatigue Truck: $Ratio_{Wn\_W} := 1$

Remaining Safe Life Factor: $f_s := 1.0$

Safe Fatigue Life Based on Past Volume: & Fatigue Truck Weight (Years)

$$Y_{l\_s} := \frac{f_s \cdot K \cdot 10^6}{T_P \cdot C \cdot \left(R_s \cdot \frac{S_{rP}}{ksi} \cdot Ratio_{Wp\_W} \right)^3} = 106.95$$

Safe Fatigue Life Based on Future Volume: & Fatigue Truck Weight (Years)

$$Y_{N\_s} := \frac{f_s \cdot K \cdot 10^6}{T_N \cdot C \cdot \left(R_s \cdot \frac{S_{rP}}{ksi} \cdot Ratio_{Wn\_W} \right)^3} = 83.56$$

Remaining Safe Fatigue Life (Years):

$$Y_{f\_s} := Y_{N\_s} \cdot \left[1 - \left(\frac{Y_P}{Y_{l\_s}} \right) \right] = 56.99$$

Finite Remaining Mean Fatigue Life (AASHTO Fatigue 3.2 - Alternative 1)

Remaining Mean Life Factor: $f_m := 2.0$

Mean Fatigue Life Based on Past Volume: & Fatigue Truck Weight (Years)

$$Y_{l\_m} := \frac{f_m \cdot K \cdot 10^6}{T_P \cdot C \cdot \left(R_m \cdot \frac{S_{rP}}{ksi} Ratio_{Wp\_W} \right)^3} = 526.29$$

Mean Fatigue Life Based on Future Volume: & Fatigue Truck Weight (Years)

$$Y_{N\_m} := \frac{f_m \cdot K \cdot 10^6}{T_N \cdot C \cdot \left(R_m \cdot \frac{S_{rP}}{ksi} \cdot Ratio_{Wn\_W} \right)^3} = 411.16$$

Remaining Mean Fatigue Life (Years):

$$Y_{f\_m} := Y_{N\_m} \cdot \left[1 - \left(\frac{Y_P}{Y_{l\_m}} \right) \right] = 384.60$$

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

There are no delaminated areas (0%) on the deck and either of the approach slabs. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction by exposing the top mat of rebar over the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard bridge deck thickness of 9 ½". The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing original armor bridge joints and the elastomeric End Bridge Joint will be replaced with armorless bridge joints. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 1.205 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the existing bridge deck, railing, bridge deck joints, and approach slabs. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier, new approach slabs and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 1.520 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069110

Visual Inspection

The bridge was constructed in 1980 with its last major rehabilitation in 2004. In 2004, bridge deck joints were replaced and miscellaneous concrete areas on the abutments were repaired under contract D259742.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have rust accumulation. The bearings on the begin abutment have debris accumulation around the pedestals and bearing elements.

Substructure

South (Begin) Abutment – The abutment stem contained salt stains and map-cracking. The salt stains were primarily a result of the leaking bridge deck joint above the abutment. The bridge seat and pedestals contained debris from deck joint and backwall spalling and previous deck joint repairs. The abutment stem, backwall and wingwalls contained small isolated spalls.

North (End) Abutment – The abutment stem was primarily wet during the inspection from leaking deck joints and leaking water lines on the bridge. The leaking water lines caused severe ice accumulation on the end cross frames, bridge seat, abutment stem, and fill slopes. Also, the additional runoff has caused undermining of the fill slope pavers resulting in a sink-hole in the abutment fill slope. The abutment stem and backwall contained isolated concrete spalls and cracks. The wingwalls also contained isolated spalls and cracks.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069110

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

100% Hands-on inspection performed on welded gusset plates – No cracks found.

Overall Steel Condition

The steel showed no sign of major deterioration. The bottom flanges were rusted with paint delaminated.

Paint

The bridge paint has delaminated from the bottom flanges and other isolated areas of the structure.

Section Loss

Due to the age of the steel, a blanket 5% section loss should be used on the bottom flanges of the exterior girders.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 16, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069110 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069110 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS
The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED
Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION
For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069110 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have **not been exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Exterior Girder, G1 Gusset Plate at Bottom Flange	733.98	3712.74
Exterior Girder, G11 Gusset Plate at Bottom Flange	805.08	4062.56
Interior Girder, G2 Gusset Plate at Bottom Flange	713.29	3610.89
Interior Girder, G10 Gusset Plate at Bottom Flange	801.59	4045.42

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total delaminated area is less than 1% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing 2-rail bridge railing and curb will be removed and replaced with new single-slope concrete bridge barrier. The sidewalk and granite curb will be removed and will be replaced with new curb, sidewalk and vertical-faced concrete barrier with pedestrian fencing attached to the top of the barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load

Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $1.50 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, sidewalk and curb, 2-rail and 4-rail bridge rail, bridge deck joints and approach slabs. The bridge deck will be replaced with a new concrete deck, new curb, sidewalk, single-slope concrete barrier, vertical-faced concrete barrier with pedestrian fencing attached to the top of the barrier and new armorless bridge joints. The approach slabs will also be replaced under this option. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $2.07 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069120

Visual Inspection

The bridge was constructed in 1980 with its last major rehabilitation in 2004. In 2004, bridge deck joints were replaced and miscellaneous concrete areas on the abutments were repaired under contract D259742.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically contained isolated areas of delaminated paint and minor rust.

Substructure

Begin Abutment – The abutment stem contained salt stains and map-cracking. The salt stains were primarily a result of the leaking bridge deck joint above the abutment. The leaking water lines caused some ice build-up on the bridge seat and abutment stem. The bridge seat and pedestals contained debris from deck joint and backwall spalling and previous deck joint repairs. The abutment stem, backwall and wingwalls contained isolated spalls.

End Abutment – The abutment stem was primarily wet during the inspection from leaking water lines on the bridge. The backwall contained isolated concrete spalls and cracks.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069110

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

100% Hands-on inspection performed of welded gusset plates – No cracks found. However, pack rust was discovered under a welded gusset plate resulting in deformation of the plate. At the time of inspection, there were no cracked welds on the deformed gusset plate.

Overall Steel Condition

The steel showed no sign of major deterioration. The bottom flanges of girders were rusted with paint delaminated. End cross frames showed signs of significant paint deterioration.

Paint

The bridge paint has delaminated from the bottom flanges and other isolated areas of the structure.

Section Loss

Due to the age of the steel, a blanket 5% section loss should be used on the bottom flanges of the girders.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 24, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069120 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069120 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 11, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069120 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have **not been exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Exterior Girder, G1 Gusset Plate at Bottom Flange	473.80	2432.45
Exterior Girder, G10 Gusset Plate at Bottom Flange	519.97	2659.63
Interior Girder, G2 Gusset Plate at Bottom Flange	455.97	2344.71
Interior Girder, G9 Gusset Plate at Bottom Flange	521.32	2666.29

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 14% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing 2-rail bridge rail on the east side of the bridge will be removed and replaced with a single-slope concrete barrier. The existing sidewalk, granite curb and 4-rail bridge rail on the west side of the bridge will be removed and replaced with a new sidewalk, curb, and vertical-faced concrete barrier with pedestrian fencing attached on top of the barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be

replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 1.520 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, 2-rail bridge rail along the east side of the bridge, sidewalk and curb with 4-rail bridge rail, bridge deck joints and approach slabs. The bridge deck will be replaced with a new concrete deck, new single slope concrete barrier along the east side and sidewalk and curbs with vertical-faced concrete barrier with pedestrian fencing attached on top of the barrier, and new armorless bridge joints. The approach slabs will also be replaced under this option. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 1.75 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069131

Visual Inspection

Miscellaneous concrete repairs were made to the abutments and approach slabs in 2002 under contract D259214. Deck joints were also replaced under this contract.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Inner bearing elements typically have minor rust scale. The outer bearings have moderate rust.

Substructure

West Abutment – The concrete backwall and pedestals contained minor isolated areas of delaminated concrete and cracking. The stem contained delaminated concrete below pedestals 2, 3, 4, and 6. The wingwall and midwall contained only minor isolated areas of delaminated concrete and cracking.

East Abutment – The concrete backwall and pedestals contained minor isolated areas of delaminated concrete and cracking. The stem had delaminated concrete below pedestals 1, 2, and 6. Rust staining was observed on the stem near pedestal 6. The wingwall and midwall contained only minor isolated areas of delaminated concrete and cracking.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069131

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – No

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

No Special emphasis details.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

The paint system was deteriorated along flanges of girders and webs of fascia girders.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 24, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069131 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069131 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS
The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED
Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION
No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

There are no delaminated areas on the deck and Begin approach slab. However, the total delaminated area of the End approach slab is 3.13% of the total End approach slab area. Due to the age, condition and chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction by exposing the top mat of rebar over the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼ " of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing original armor bridge joints will be replaced with armorless bridge joints. The Level 1 Load rating for the final condition was

found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.423 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete removal of the existing bridge deck, railing, bridge deck joints, and approach slabs. The bridge deck would be replaced with updated single-slope concrete barrier, new approach slabs and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.580 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

BIN 1069132

Visual Inspection

Miscellaneous concrete repairs were made to the abutments in 2002 under contract D259214. Deck joints were also replaced and the bearings were restored under this contract.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have minor rust scale.

Substructure

West Abutment – Concrete backwall contained minor isolated areas of delaminated concrete and cracking and had heavy rust staining. The stem contained minor cracks and delaminated concrete near pedestals 8, 9, 10, 11, and 12. The pedestal concrete did not appear to be delaminated. The left cheek wall exhibited map cracking the full height.

East Abutment – Concrete backwall contained minor isolated areas of delaminated concrete and cracking and had heavy rust staining. The stem contained minor cracks and delaminated concrete near pedestals 8, 11, and 12. The pedestal concrete did not appear to be delaminated.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069132

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – No

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

No Special emphasis details.

Overall Steel Condition

The steel showed no sign of major deterioration. There were no isolated pockets of major section loss and no areas of concern were observed.

Paint

The paint system was deteriorated along flanges of girders and webs of fascia girders.

Section Loss

Due to the age of the steel a blanket 5% section loss should be used in load rating.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 24, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069132 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069132 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS
The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED
Bearing replacements and seat width improvements are not required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION
No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

There are no delaminated areas on the Begin approach slab, three delaminated areas on the deck and two delaminated areas on the End approach slab. The total delaminated area of the bridge deck is 1.41 % of the total deck area and the total delaminated area of the End approach slab is less than 1% of the total End approach slab area. Due to the age, condition and chloride-ion content of the bridge deck concrete in the 1" and 2" depths, the bridge deck should be rehabilitated or replaced to meet current design standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC + 30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction by exposing the top mat of rebar over the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair

treatment as the deck. The existing original armor bridge joints will be replaced with armorless bridge joints. The Level 1 Load rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 0.422 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete
This option would involve the complete removal of the existing bridge deck, railing, bridge deck joints, and approach slabs. The bridge deck would be replaced with updated single-slope concrete barrier, new approach slabs and new armorless bridge joints. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 0.580 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels
This option will have the highest construction cost of all the options; however, traffic control costs may be lower due to the reduced construction time. Comparison of accelerated construction versus conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069141

- **In-Depth Condition:**

Visual Inspection: Miscellaneous concrete repairs were made to the abutments, bearing restoration, guide railing and joint replacement under contract D259214 (10/02).

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** See Bridge Deck Evaluation Report.
- **Steel –** See Structural Steel Inspection Summary.
- **Bearings –** Bearings were restored under contract D259214 (10/02)

- **Substructure**
  - **West Abutment (Begin) –** There are large areas of delaminated concrete along the abutment and backwall. The south wing wall has moderate spalling and a significant vertical crack. With the exception of pedestal 3, pedestals appear in good condition. Pedestal 3 has major cracking and some spalled concrete. The area immediately below pedestal 3 is delaminated.

  - **Pier #1 (west pier) –** The pier, which has no joint in the deck above, is in good condition except for a single 3” by 3” by 2’ deep spall on the front face of pedestal #2 and a single small crack in the end face of pedestal #3. The capbeam and columns soundings are in good condition.

  - **Pier #2 (east pier) –** The pier, which has no joint in the deck above, is in good condition except for minor cracks in the front, right, and end faces of pedestal #5, and a thin hairline crack in the capbeam just

above the right edge of the right column on the beginning face. There is some map cracking with sound concrete in the right half of the right column on the end face. That portion of the capbeam which extends out on the right side and doesn't support any load has a few cracks with light hollowness on the end face.

- **East Abutment (End) –** Pedestals and abutment are in good condition. There is minor cracking on pedestal 2 and some delamination on pedestal 3. There is isolated delamination on the backwall.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069141

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – Yes
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details:

Horizontal gusset plates welded to tension flanges of girders were inspected as required.

Overall Steel Condition:

Paint: Girders are the weathering steel type so no paint exists to report on, however, read section loss notes below.

Section Loss: The weathering steel is scaling in localized areas, particularly along bottom flanges with the fascia girders in worst condition.
Steel at the abutments showed some light to moderate scaling at the bottom flanges and the bottom half of the beam webs.

Due to the age of the steel a blanket 5% section loss should be used in load rating.

Girder Conditions: Except for the section loss outlined above the remaining girders are all in good condition on all spans.

Bearings: Pier #1 bearings are the expansion type with the top Teflon pad delaminating at the edges. Pier #2 fixed bearings appear in good condition.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over CSX Railroad. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over CSX Railroad. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1069141 Interstate Route I-481 South Bound over CSX Railroad

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069141 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069141 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or piers. Seat width improvements are required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **MARCH 19, 2015**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069141 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the controlling span (Span 2) of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components for girder G105 in span 2 have been **exhausted.**

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 2, Exterior Girders G101, Gusset Plate at Bot. Flange, Midspan	8.26	114.70
Span 2, Interior Girders G102, Gusset Plate at Bot. Flange, Midspan	52.24	331.11
Span 2, Interior Girders G103, Gusset Plate at Bot. Flange, Midspan	144.49	785.06
Span 2, Interior Girders G104, Gusset Plate at Bot. Flange, Midspan	42.52	283.26
Span 2, Exterior Girders G105, Gusset Plate at Bot. Flange, Midspan	-1.17	68.28

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area was less than 1% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard of 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced with standard 3" of concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be replaced with armorless bridge joints. This

option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $1.97 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, 2-rail bridge railing, bridge deck joints and approach slabs. The bridge deck would be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The approach slabs will also be replaced under this option. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $2.43 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069142

- **In-Depth Condition:**

Visual Inspection: Miscellaneous concrete repairs were made to the abutments, bearing restoration, guide railing and joint replacement under contract D259214 (10/02).

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

- **Deck –** See Bridge Deck Evaluation Report.
- **Steel –** See Structural Steel Inspection Summary.
- **Bearings –** Bearings were restored under contract D259214 (10/02)

Substructure

- **West Abutment (Begin) –** There is spalling along the underside of the joint with the worst at the top of the back wall above pedestal 1. The pedestals are in fair to good condition with some light to moderate delamination. The backwall has moderate delamination in between pedestals. The top corner of the abutment between pedestals 3 and 4 and pedestals 4 and 5 are delaminated and have a deep horizontal crack.

- **Pier #1 (west pier) –** There is heavy spalling to 3" deep for the top 24" by 8' long on the beginning face of the pier capbeam for that portion which extends out from the left column and doesn't support any load . The first pedestal sits over the column so the spalling at this time is not a major concern. The same condition exists on the opposite side of the capbeam but with no spalling and basically all hollowness. Pedestal #1 has some minor cracking on the front (begin) face as does #5 on the right face. There are very fine cracks on the bottom of the

capbeam below ped #5. Rest of capbeam and columns in good condition.

- **Pier #2 (east pier) –** Except for minor cracking on the beginning faces of pedestals #1 & #5 the capbeam and columns are in good condition.

- **East Abutment (End) –** All pedestals show significant deterioration. Signs of significant water infiltration through the joint are present. Pedestals 1, 2, and 3 have significant spalling. Pedestals 1 and 2 have exposed rebar. Pedestals 4 and 5 have delaminated concrete. The back walls have moderate delamination. The abutment between pedestals 3 and 4 have significant delaminationon the bottom half of the abutment.

STRUCTURAL STEEL INSPECTION SUMMARY

BIN 1069142

Special Emphasis Inspection Required
Non-Redundant/Fracture Critical Members – No
Pin and Hangers – No
Fatigue-Prone Welds – Yes
Non-Categorized Fatigue-Prone Details – No
Other (Specified in Text) – No

Special Emphasis Details:
Horizontal gusset plates welded to bottom flanges of girders were inspected as required.

Overall Steel Condition:

Paint: Girders are the weathering steel type so no paint exists to report on, however, read section loss notes below.

Section Loss: The weathering steel is scaling in localized areas, particularly along bottom flanges with the fascia girders in worst condition.
Steel at the abutments showed some moderate scaling at the bottom flanges and the bottom half of the beam webs.

Due to the age of the steel a blanket 5% section loss should be used in load rating.

Girder Conditions: A thin horizontal crack was found in a defective weld between the bottom flange of a girder and the horizontal gusset plate. This occurred on Span #2 in girder #4 in the sixth (6th) gusset plate from the end of the span. NYSDOT was notified on January 28, 2014 about this condition. Except for the cracked weld and section loss outlined above the remaining girders are all in good condition on all spans.

Bearings: Pier #1 bearings are the expansion type with the top Teflon pad delaminating at the edges. Pier #2 fixed bearings appear in good condition.

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over CSX Railroad. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over CSX Railroad. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1069142 Interstate Route I-481 North Bound over CSX Railroad

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: FEBRUARY 24, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069142 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069142 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

You created this PDF from an application that is not licensed to print to novaPDF printer (http://www.novapdf.com)

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements are not required at the abutments or piers. Seat width improvements are required at the abutments. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **APRIL 2, 2015**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069142 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the controlling span (Span 2) of the existing bridge are shown below. The remaining safe fatigue life of the fatigue component for girder G105 at midspan of span 2 has been **exhausted.**

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 2, Exterior Girder G106, Gusset Plate at Bottom Flange, Midspan	8.32	115.00
Span 2, Interior Girder G107, Gusset Plate at Bottom Flange, Midspan	46.65	303.60
Span 2, Interior Girder G108, Gusset Plate at Bottom Flange, Midspan	136.37	745.08
Span 2, Interior Girder G109, Gusset Plate at Bottom Flange, Midspan	38.10	261.54
Span 2, Exterior Girder G110, Gusset Plate at Bottom Flange, Midspan	-0.34	72.40

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is less than 1% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay

The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objectives of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal

This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove chloride-ion contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced with standard 3" of concrete cover. The existing non-conforming bridge railing will be removed and replaced with single-slope concrete barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing bridge joints will be replaced with armorless bridge joints. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $1.97 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option will involve the complete demolition of the existing bridge deck, 2-rail bridge railing, bridge deck joints and approach slabs. The bridge deck will be replaced with a new concrete deck, new single-slope concrete barrier and new armorless bridge joints. The approach slabs will also be replaced under this option. The new bridge deck would have a 9 ½" standard thickness as compared to the 9 ¼" existing thickness. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $2.43 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

BIN 1069151

Visual Inspection

The bridge was constructed in 1980. The deck joints were replaced in 1995 under contract D256745. In 2006 under contract D260442, miscellaneous concrete repairs were made, new bearings were installed, and a new deck overlay and bridge joints were placed.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically have minor rust scale.

Substructure

West Abutment – The concrete backwall and pedestals contained only minor isolated areas of delaminated concrete and cracking. The stem had delaminated concrete on the top surface next to pedestal 3, on the west face between pedestals 3 and 4, and next to pedestal 5. Between pedestal 6 and wingwall the stem had cracked around an existing patch. The wingwalls had minor isolated areas of delaminated concrete and cracking.

Pier 1 – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The cap beam had spalling with exposed rebar on the edge below pedestal 1 and below pedestal 3. The bottom face of the cap beam below pedestal 6 was delaminated and contained a small area of spalling concrete. The south column had an area of delaminated concrete on the west face.

East Abutment – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The stem had minor cracking below

pedestals 1 and 6, and rust staining below pedestals 1, 5, and 6. The backwall had spalling concrete above pedestals 1 and around pedestal 5. The wingwalls had minor isolated areas of delaminated concrete and cracking.

BIN 1069151

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Gusset plate welds require 100% hands-on inspection. No defects were observed.

Overall Steel Condition

Isolated pockets of up to 20% section loss were observed on the bottom flanges of the fascia girders. An existing gusset plate weld repair was observed in bay 2 of span 2, 2nd crossframe from the east abutment. Exterior girders displayed the most significant deterioration. The interior girders were less deteriorated.

Paint

The lower outer fascia flanges, top surface, were pitted and flacking for the full lengths. The bottom flanges of the fascia girders contained the most paint deterioration, specifically the top surface of the bottom flange, which contained widespread paint delamination with isolated pockets of pitting rust.

Section Loss

Due to the age of the steel, a blanket 5% section loss to the bottom flanges should be used in conjunction with localized areas of greater section loss of the fascia girders in load rating.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over CR 7 and Butternut Creek. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over CR 7 and Butternut Creek. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1069151 Interstate Route I-481 South Bound over CR 7 and Butternut Creek

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 7, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069151 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069151 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE 055928

DATE: **JUNE 9, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069151 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has **not been exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Interior Girders, Gusset Plate at Bottom Flange	52.15	335.03
Span 1, Interior Girders, Gusset Plate at Top Flange	891.03	4462.94
Span 1, Exterior Girders, Gusset Plate at Bottom Flange	43.46	292.25
Span 1, Exterior Girders, Gusset Plate at Top Flange	876.89	4393.36

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total delaminated area is approximately 6% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC +30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the addition of ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing non-conforming bridge railing will be removed and replaced with new single-slope concrete bridge barrier. The existing approach slabs will receive the same repair treatment as the deck. The existing deteriorated bridge joints will be replaced with armorless bridge joints. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $1.25 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete

This option would involve the complete demolition of the existing bridge deck, 2-rail bridge rail, bridge deck joints and approach slabs. The bridge deck will be replaced with a new concrete deck, single-slope barrier and new armorless bridge joints. The approach slabs would also be replaced under this option. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating for the final condition was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $1.46 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels

This option will have the highest construction cost of all of the options however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069152

Visual Inspection

The bridge was constructed in 1980. The deck joints were replaced in 1995 under contract D256745. In 2006 under contract D260442, miscellaneous concrete repairs were made, new bearings were installed, and a new deck overlay and bridge joints were placed.

Cracks, spalls, and other field observations are shown on the plans. Below is a brief summary of conditions for each feature.

Superstructure

Deck – See Bridge Deck Evaluation Report

Steel – See Structural Steel Inspection Summary

Bearings – Bearing elements typically had minor rust scale. The outer bearings on the pier had moderate rust buildup.

Substructure

West Abutment – The concrete pedestals contained only minor isolated areas of delaminated concrete and cracking. The stem contained delamination between pedestals 2 to 3 and 4 to 5. The backwall had delaminated concrete near pedestals 1, 5, and 6. The wingwalls had minor isolated areas of delaminated concrete and cracking.

Pier 1 – The concrete cap beam, pedestals and columns contained only minor isolated areas of delaminated concrete and cracking.

East Abutment – The concrete backwall, stem, and pedestals contained only minor isolated areas of delaminated concrete. The stem contained some cracking around existing concrete repairs. The wingwalls had minor isolated areas of delaminated concrete and cracking.

BIN 1069152

Special Emphasis Inspection Required

Non-Redundant/Fracture Critical Members – No

Pin and Hangers – No

Fatigue-Prone Welds – Yes

Non-Categorized Fatigue-Prone Details – No

Other (Specified in Text) – No

Special Emphasis Details

Gusset plate welds require 100% hands-on inspection. No defects were observed.

Overall Steel Condition

Isolated pockets of up to 20% section loss were observed on the bottom flanges of the fascia girders. Exterior girders displayed the most significant deterioration. The interior girders were less deteriorated.

Paint

The lower outer fascia flanges, top surface, were pitted and flacking for the full lengths. The bottom flanges of the fascia girders contained the most paint deterioration, specifically the top surface of the bottom flange, which contained widespread paint delamination with isolated pockets of pitting rust.

Section Loss

Due to the age of the steel, a blanket 5% section loss to the bottom flanges should be used in conjunction with localized areas of greater section loss of the fascia girders in load rating.

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over CR 7 and Butternut Creek. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over CR 7 and Butternut Creek. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1069152 Interstate Route I-481 North Bound over CR 7 and Butternut Creek

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

TO: FILE (190.514.001)

FROM: JESSICA S. BAUER, P.E.
NYSPE 084915

DATE: MARCH 7, 2014

C&S PROJECT NO.: 190.514.001

RE: SEISMIC ASSESSMENT SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1069152 Seismic Assessment

This memorandum summarizes the seismic assessment conducted for BIN 1069152 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the assessment is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the assessment results, retrofits required and recommendations for further seismic evaluation of the structure.

ASSESSMENT PROCEDURE

The seismic assessment was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic assessment was performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the assessment are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic assessments of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic assessment because the spectral

acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic assessments of bridges in the Syracuse area.

Bridge parameters used in the seismic assessment were retrieved from the record drawings and WinBolts data.

The seismic assessment takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

ASSESSMENT RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Bearing replacements and seat width improvements are not required at the abutments or pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

TO: **FILE (190.514.001)**

FROM: **PAUL BYRNE, P.E.**
NYSPE

DATE: **JUNE 10, 2014**

C&S PROJECT NO.: 190.514.001

RE: **NEW YORK STATE DEPARTMENT OF TRANSPORTATION**
D031085; PIN 3501.60; I-81 Opportunities, BIN 1069152 Fatigue Evaluation

---

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have **not been exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Span 1, Interior Girders, Gusset Plate at Bottom Flange	58.70	367.29
Span 1, Interior Girders, Gusset Plate at Top Flange	964.18	4822.89
Span 1, Exterior Girders, Gusset Plate at Bottom Flange	49.41	321.55
Span 1, Exterior Girders, Gusset Plate at Top Flange	949.00	4748.19

E. Recommendations:

The purpose of this deck evaluation is to document and determine existing conditions of the deck. It will be used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area is approximately 4% of the total deck area. Due to the age, condition and high chloride-ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet current standards and to mitigate excessive future maintenance costs.

Option 1 – Scarify and Bridge Deck Overlay
The maximum service life this option would provide is 25 years. The design life of this project is 30 years (ETC+30). This option does not meet the project objective of obtaining 30+ years of service life.

Option 2 – Bridge Deck Rehabilitation with 100% Deep Removal
This option will involve partial depth reconstruction with top mat rebar exposure of the entire bridge deck to remove the chloride contaminated concrete (100% deep removal). The existing bridge deck thickness is 9 ¼" with 3 ¼" of concrete cover over the top mat of reinforcing. The proposed partial depth reconstruction will include the additional ¼" of concrete to provide the standard 9 ½" bridge deck thickness. The existing top mat of reinforcing bars will be removed and replaced to accommodate the standard 3" of concrete cover. The existing 2-rail bridge railing will be removed and replaced with new single-slope concrete bridge barrier. The existing approach slabs will receive the same treatment as the deck. The existing bridge joints will be replaced with new armorless bridge joints and seals. The Level 1 Load Rating for the final condition was found to be

acceptable. This option would provide a service life of 35 years to the bridge deck. The construction cost of this option is $ 1.09 million.

Option 3 – Bridge Deck Replacement with Cast-In-Place Concrete
This option would involve the complete demolition of the existing bridge deck, 2-rail bridge rail, and bridge deck joints. The bridge deck will be replaced with a new concrete deck, single-slope barrier and new armorless bridge joints. The approach slabs would also be replaced under this option. The new bridge deck would be 9 ½" standard thickness as compared to the 9 ¼" existing thickness. The Level 1 Load Rating was found to be acceptable. This option would provide a service life of 40 years to the bridge deck. The construction cost of this option is $ 1.26 million.

Option 4 – Bridge Deck Replacement with Pre-cast Concrete Deck Panels
This option will have the highest construction cost of all the options, however; traffic control costs may be lower due to reduced construction time. Comparison of accelerated construction to conventional construction is beyond the scope of work for this project at this time.

IN-DEPTH CONDITION DOCUMENTATION

IN DEPTH INSPECTION REPORT

BIN 1069160

- **In-Depth Condition:**

Visual Inspection:

Cracks, spalls, and other field observations are shown on the plans. Below is a ` brief summary of conditions for each feature.

Superstructure

- **Deck –** There is no Bridge Deck to evaluate. Structure is a two cell curved concrete box culvert.
- **Steel –** There is no Structural Steel to inspect. Structure is a two cell curved concrete box culvert.
- **Bearings –** There are no bearings for this structure. Structure is a two cell curved concrete box culvert.

Substructure

- Structure is a two cell curved concrete box culvert with nine individual pours from left to the right. The bridge is orientated North. The inlet is on the left and outlet on the right.

- **CELL #1 –** Pours 1& 2 have two thin full height cracks with associated hollowness on the pier face. Pour 3 in good condition. Pours 4 &5 have 2/3 hairline cracks across the top slab with minor efflorescence seepage through the cracks. Some cracks extend down through both walls. Pours 6 & 7 in good condition with minor seepage through ceiling joint between the two pours. Pour 8 has three thin full height cracks on the pier wall and pour 9 has a single full height crack in the beginning wall.

- **Cell #2 –** Pours 1 & 2 in good condition. Pour 3 has thin crack across top slab and extends to midheight down the end wall with efflorescence seepage. Pour 4 has two similar cracks as in pour 3. Pour 5 has a thin vertical crack in pier wall. Pours 6-8 in good condition. Pour 9 has single hairline vertical crack for 3' from the bottom near end of abutment wall.

- **Fascias/Wing Walls –** Begin wing wall right has cracking, spalling, and delamination for nearly full height in beginning abutment wall and construction joint with wingwall for 3" wide.

STRUCTURE IDENTIFICATION

a. Bridge Identification Number (BIN): 1031529
b. Reference Marker: 81I 3303 2021
c. Region: NYSDOT Region 3
d. County: Onondaga
e. Town: City of Syracuse
f. Feature Carried: I-81
g. Feature Crossed: E. Calthrop Avenue

INTRODUCTION

a. Bridge History
   i. Year Built: 1965
   ii. Bridge Type: Three Span, Steel Multi-girder
   iii. Span Lengths:
      Span 1 Length: 34 feet
      Span 2 Length: 65 feet
      Span 3 Length: 42 feet
   iv. Out-to-Out Width: 100 feet
   v. Structural Ratings and Rankings
      1. Federal Sufficiency: 93.7 (September 2013)
      2. Condition Rating: 5.651 (September 2013)
      3. General Recommendation: 6
   vi. Live Load Posting (HS25): No
   vii. National Highway System (NHS): Yes
   viii. Previous work Done: Wearing surface overlay (1985). Paint metal surfaces (1985,2003). Conc. overlay NB (1990). Repair steel superstructure (1992,2003). Seal substructure (2003). Conc. substructure repairs & bearing restoration (2008). Deck & joint replacement (2012).
   ix. Planned Future Work: N/A
b. Highway Classification
   i. Functional Classification: Urban Principle Arterial - Interstate
   ii. Traffic Volumes

YEAR	AADT Projected
2014	53455
2034	79432

SHEET: 1 OF 3

DATE: 4/1/2014

FEATURE CARRIED: I-81
FEATURE CROSSED: E. CALTHROP AVE.

TEAM LEADER: A.THOMPSON

A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
	The deck was replaced in 2012. Deck and top side elements were not inspected as part of this in-depth inspection.	
TP 349-24	Begin Abutment – Bearings: The fascia bearings and bearings 7 and 8 have rust and delamination but are functioning (Photo 1). The remainder of the bearings are in good condition.	1
TP 349-26	Begin Abutment – Seats and Pedestals: The bridge has stub abutments with no bridge seats. There is a 16” x 5” hollow area on the right face of Pedestal 3 that extends to the top 5” (Photo 2). Pedestal 9 has an 18” x 9” hollow area on the right face at the bottom (Photo 3). There is a 16” x 6” hollow area on the left face of Pedestal 11 that extends to the top 5” (Photo 4). The remainder of the pedestals are in good condition.	2-4
TP 349-28	Begin Abutment – Backwalls: There is one hollow area at the right measuring 2.5’ long x 16” high (Photo 5). The remainder of the backwall is in good condition.	5
TP 349-25	End Abutment – Bearings: The end abutment bearings are expansion sliding on bronze plates. The bronze plates are bowed due to pack rust on bearings 1-11 with bearing 10 being the most severe (Photo 6). Bearings 12-14 are in good condition with only minor surface rust.	6
TP 349-27	End Abutment – Seats and Pedestals: The bridge has stub abutments with no bridge seats. There is an 18” x 27” hollow area on the left face of Pedestal 10 (Photo 7). The remaining pedestals are in good condition.	7
TP 350-28	Spans 1 - 3 - Superstructure – Primary Members: Fascia Girder 14 in Span 2 had impact damage that was repaired in 1992. There is currently less severe impact damage resulting in the web being out of plumb and the bottom flange being deformed (Photos 8, 9, 10, 11). The girder was given a hands-on inspection and no cracks were found (Photo 12). The 2013 Level II Load Rating included top flange section loss in Span 1 discovered when the deck was removed. Girder 1 had 15% section loss to its top flange for the entire span length. Girder 6 had the same section loss as Girder 1. Girder 7 had 50% section loss for the first 3’; then 15% section loss for the next 22.44’; and finally 20% section loss for the last 8.48’. The section loss is not visible from below (Photo 13).	8-13

ITEM	REMARKS	PHOTO N0.
TP 350-30	Spans 1 through 3 - Superstructure – Paint: The tops of the fascia outside bottom flanges have +/-20% paint failure in all spans (Photo 14). The fascia outside web faces typically have +/-5% paint failure except Spans 1 and 2 near Pier 1 on the left where the bottom 5” has failed and has rust, delamination and minor pitting (Photos 15 and 16). There is no significant section loss to the overall height of the web at this location. Interior and fascia bottom faces of bottom flanges have areas of top coat failure exposing the bottom coat (Photo 8). Ends of girders and end diaphragms have up to 50% paint failure in locations of previously leaky joints (Photo 17).	8,14-17
TP 350-33	Pier 1 – Bearings: The begin row of bearings on Pier 1 are expansion sliding on bronze plates. The bronze plates appear in good condition with no significant distortion. The bearing plates in both rows have up to 50% paint failure, rust staining, and minor rust and delamination (Photo 18).	18
TP 350-37	Pier 1 – Cap Beam: There are several hollow sounding areas detailed in the Pier 1 Deterioration Sketch including a 3.7 square foot hollow area on the underside at the right and 2.5 square foot hollow area in the end face over Column 4 adjacent to Pedestal 9 (Photo 19). The cap beam also has areas of hairline and map cracking.	19
TP 350-38	Pier 1 Columns: There are hollow areas in the Column 6 end and left faces as detailed in the Pier 1 Deterioration Sketch (Photo 20). The remainder of the columns have hairline cracking but sound solid.	20
TP 350-33	Pier 2 – Bearings: The begin row of bearings on Pier 2 are expansion sliding on bronze plates. The bronze plates appear in good condition with no significant distortion. The bearing plates in both rows have up to 50% paint failure, rust staining, and minor rust and delamination (Photo 21).	21
TP 350-37	Pier 2 – Cap Beam: There are several hollow sounding areas detailed in the Pier 2 Deterioration Sketch including a 6.0 square foot cracked and hollow area on the begin face over Column 3 and a 3.3 square foot hollow area on the begin face under fascia Pedestal 14 (Photo 22). The cap beam also has areas of hairline and map cracking.	22
TP 350-38	Pier 2 Columns: There are hollow areas in the Column 5 begin face as detailed in the Pier 2 Deterioration Sketch (Photo 22). The remainder of the columns have areas of hairline cracking but sound solid.	22

ITEM	REMARKS	PHOTO N0.
	Special Emphasis Inspection Required Non-Redundant/Fracture Critical Members - No Pin and Hangers - No Fatigue-Prone Welds - Yes Non-Categorized Fatigue-Prone Details - No Other - No Category E welds – Span 2 interior girders – welds at ends of cover plates (Photo 23). Category D and E welds - angles welded to bottom flanges in Span 2 near begin and end (Photo 24 and 25). Category D welds at clips to junction box Girder 1 at end of Span 2 (Photo 26).	23-26

SUBSTRUCTURE NOTES

1. TOP OF BACKWALLS ON WHICH ASBESTOS SHEET PACKING IS TO BE PLACED SHALL BE STEEL TROWEL FINISHED.
2. BITUMINOUS MATERIAL, ITEM 61, SHALL BE APPLIED TO THE BACKS OF ALL ABUTMENTS AND WINGWALLS ABOVE TOP OF FOOTINGS, WHERE FILL IS IN CONTACT WITH THE WALLS.
3. EPOXY PROTECTIVE COATING FOR CONCRETE SHALL BE APPLIED TO THE FOLLOWING SURFACES:
   ABUTMENTS - ALL EXPOSED PEDESTAL SURFACES, BRIDGE SEATS; EXPOSED VERTICAL SURFACES OF BACKWALL AND CURTAIN WALLS FACING THE SUPERSTRUCTURE.
   PIERS - ALL PEDESTAL SURFACES AND THE TOP SURFACES OF PIER BETWEEN PEDESTALS INCLUDING THE EDGE CHAMFER AT TOP EDGE OF PIER.
4. THE MAXIMUM FOUNDATION PRESSURES FOR DESIGN PURPOSES: ABUTMENT - 1.5 TONS PER SQUARE FOOT; PIER - 5 TONS PER SQUARE FOOT.
5. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FOR REINFORCING STEEL IN THE SUBSTRUCTURE SHALL BE AS FOLLOWS:

FOOTINGS (INCLUDING UNFORMED BOTTOM)	3"
WALLS ABOVE FOOTINGS	2"
BEAMS AND COLUMNS OF PIERS	2"

6. ITEM 83TX TO BE USED ONLY WHERE DEPTH OF EXCAVATION EXCEEDS 5 FEET.

NOTES:
1. TOP OF BACKWALL IS HORIZONTAL WITHIN THE AREAS MARKED "H", AND SLOPED WITHIN THE AREAS MARKED "S".
2. TYPICAL ABUTMENT SECTION, TYPICAL WING WALL SECTION AND WING WALL ELEVATION ARE SHOWN ON DWG. NO. F-7.
3. SECTION A-A AND DETAILS OF JOINTS AND CATCH BASIN ARE SHOWN ON DWG. NO. F-8.
4. ADDITIONAL PAYMENT ITEMS AND LIMITS FOR ABUTMENT AND WING WALLS ARE SHOWN ON DWG. NOS. F-2, F-4 & F-7.
5. FOR SPACING OF RAILING POSTS AND RAILING DETAILS SEE DWG. NOS. F-17 & F-18.

TYPICAL BRIDGE SECTION
0 1 2 3 m

ELEMENT SPECIFIC WORK TO BE DONE ON BIN 1031529:

1. ESTABLISH M&PT SCHEMES.
2. REMOVE ARMORED COMPRESSION SEAL JOINTS AT THE FOLLOWING LOCATIONS:
   - SOUTH ABUTMENT
   - PIER 1
   - PIER 2
   - NORTH ABUTMENT
3. INSTALL NEW ARMORLESS BRIDGE JOINT SYSTEM AT THE FOLLOWING LOCATIONS:
   - SOUTH ABUTMENT
   - PIER 1
   - PIER 2
   - NORTH ABUTMENT
4. SAWCUT CONCRETE TO PROVIDE ADEQUATE SPACE FOR PROPER EXPANSION AND CONTRACTION OF THE PROPOSED JOINTS, ITEM 02520.20 M.
   - PIER 1
   - PIER 2
5. CONTRACTOR SHALL COORDINATE RELOCATION OF CONDUIT & REPLACEMENT OF LIGHT STANDARDS WITH NIAGARA MOHAWK.
6. PERFORM CONCRETE REPAIRS FOR THE FOLLOWING SUBSTRUCTURE ELEMENTS:
   - SOUTH ABUTMENT - BACKWALL, PEDESTALS
   - PIER 1 - CAP BEAM, COLUMNS, AND PEDESTALS
   - PIER 2 - CAP BEAM, COLUMNS, AND PEDESTALS (STRUCTURAL LIFTING REQUIRED)
   - NORTH ABUTMENT - BACKWALL, PEDESTALS

   UNSUPPORTED COLUMNS, CAP BEAMS OR PEDESTALS WILL BE REPAIRED ONLY 25% AT A TIME.
7. REMOVE AND REPLACE PEDESTAL IN KIND AT THE FOLLOWING LOCATIONS:
   - PIER 1 - PEDESTAL 1
   - PIER 2 - PEDESTAL 2
   - NORTH ABUTMENT - PEDESTAL 12
8. REPAIR CRACKS IN THE SUBSTRUCTURES WITH INJECTION GROUTING.
9. ALL BEARINGS THAT DO NOT RECEIVE RESTORATION SHALL RECEIVE MAINTENANCE PAINTING AND LUBRICATION, TIGHTEN NUTS ON ANCHOR BOLTS AS NECESSARY.
10. REPLACE APPROXIMATELY 8 SM OF CONCRETE PAVING BLOCKS AT THE TOP RIGHT OF THE BEGIN ABUTMENT
11. PERFORM LOW STEEL FIXED BEARING RESTORATION AT THE FOLLOWING LOCATION:
    - PIER 1 - BEARINGS 1 - 14
    - PIER 2 - BEARINGS 1 - 14

    RESTORATION WORK SHALL INCLUDE THE FOLLOWING ITEMS:
    (1) STRUCTURAL LIFTING UNDER LIVE LOAD
    (2) REPLACEMENT OF SHEARED ANCHOR BOLTS AS NEEDED (IF PEDESTAL IS NOT SCHEDULED FOR REPLACEMENT, REMOVE TOP 150 mm OF CONCRETE PEDESTAL, ITEM 580.01 M AND ITEM 555.09 M)
    (3) COMMERCIAL BLAST CLEAN TO NEAR WHITE FINISH
    (4) MAINTENANCE PAINTING
    (5) BEARING LUBRICATION
    NOTE: FIXED BEARINGS SHALL NOT BE DISASSEMBLED UNLESS A.O.B.E.
12. PERFORM LOW STEEL EXPANSION BEARING RESTORATIONS AT THE FOLLOWING LOCATIONS:
    - PIER 1 - BEARINGS 1 - 14
    - PIER 2 - BEARINGS 1 - 14
    - NORTH ABUTMENT - BEARINGS 1 - 14

    RESTORATION WORK SHALL INCLUDE THE FOLLOWING ITEMS:
    (1) STRUCTURAL LIFTING UNDER LIVE LOAD
    (2) REPLACEMENT OF BRONZE EXP. BEARING PLATE
    (3) COMMERCIAL BLAST CLEAN TO NEAR WHITE FINISH
    (4) MAINTENANCE PAINTING
    (5) BEARING LUBRICATION
13. APPLY CONCRETE PROTECTIVE SEALER TO ALL EXPOSED SUBSTRUCTURE AND PARAPET AREAS.
14. PERFORM CONCRETE REPAIRS FOR PARAPETS AND INSTALL LIGHTING CONDUIT AND CONDUCTOR ALONG BACK EDGE OF PARAPET AND CAST IRON JUNCTION BOXES AT EACH LIGHT STANDARD IN ORDER TO MAINTAIN HIGHWAY LIGHTING AFTER THE PARAPET SECTIONS HAVE BEEN CUT.
15. COLUMN AND STEM REPAIR AREAS EXTEND PAST EXISTING GRADE AND THEREFORE, CONCRETE PAVING BLOCKS AND ASPHALT WORK IS REQUIRED AT THE BASE OF THE COLUMNS FOR THE FOLLOWING SUBSTRUCTURES:
    - PIER 1, 2
    - NORTH ABUTMENT
16. SEE DWG. BR-2 FOR DETAILS FOR PLACEMENT OF GALVANIC ANODES IN PEDESTAL REPAIR AREAS, ITEM 16582.99 M.

APPROXIMATE LOCATION OF EXISTING 50 mm ø CONDUIT. WEST PARAPET SIMILAR. RELOCATE USING NEW CONDUIT ITEM 670.2003 M. SEE NOTE 5 & CD-1 (TYP.)

SPECIAL NOTE: ALL DIMENSIONS ARE SHOWN IN MILLIMETERS UNLESS OTHERWISE NOTED

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 81 Bridge over Calthrop Avenue. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-03152-9 Interstate Route 81 over Calthrop Avenue

Type of Material	Estimated Amount
Caulking Compound	3 Linear Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 81 Bridge over Calthrop Avenue (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-03152-9 Interstate Route 81 over Calthrop Avenue

Caulking Compound

Asbestos-containing caulking compound is located in the following areas of the bridge:

- Around a few guide rail base plates (widely scattered)
- Around lighting conduit in expansion joints in parapet walls

The caulking compound around the lighting conduit is only visible in the expansion joints in the west parapet, due to the relatively large gap at these joints. For estimating purposes, this caulking compound is assumed to be located in all the expansion joints on both parapets, even though its presence cannot be visually confirmed.

It is estimated that the total amount of this caulking compound on the bridge is approximately 3 linear meters. This estimate is based on field observations made at the time of the site visit.

The approximate locations of this material are shown in the attached FIGURE 2. Analytical results of bulk samples collected are summarized in the attached TABLE.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

FEATURE CARRIED: **I-81 Southbound/Northbound**

FEATURE CROSSED: **E. Calthrop Ave.**

TABLE OF CONTENTS

- LOAD RATING SUMMARY
- FIGURES (BRIDGE CROSS SECTION, FRAMING PLAN, AND GIRDER ELEVATION)
- AASHTOWARE BRIDGE RATING (FORMERLY VIRTIS) INPUT DATA
- AASHTOWARE BRIDGE RATING (FORMERLY VIRTIS) OUTPUT DATA
- RECORD DRAWINGS

Notes and Assumptions:

1. Load rating analysis of existing superstructure was performed by using AASHTOWare Bridge Rating software per project scope.
2. Based on In-depth bridge inspection report dated 4/1/2014, there was no significant section loss observed for the existing girders (except span 1 girders, top flange section loss as noted). However, due to the age of the steel a blanket 5% section loss was included in load rating.
3. Substructure is not included in the load rating analysis unless otherwise noted.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

Notes:
* All flange length dimensions are horiz. (length along flange may differ).
* Transverse stiffener pairs shown in red.
* Single transverse stiffener shown in blue.
* Bearing stiffeners shown in green.
* Dimensioning starts and ends at CL bearings.
* X denotes cross frame locations.

AASHTOWARE BRIDGE RATING (FORMERLY VIRTIS)

INPUT DATA

Username: brr
Date: Tuesday, April 15, 2014 11:22:58

Bridge ID 1031529 1031529

NBI Structure ID (8): 1031529
Description: Updated by R. Liptack, 4/9/2014
Checked by K. Chau, 4/11/2014

Comments: Due to the age of the steel, a blanket 5% section loss is included in load rating. Span lengths and typical sections were updated.

Updated by M. Kostakis 11/07/2013:
Checked by M. Macie, 2/4/2014
2013 changes:
1. Accelarated Bridge Deck Replacement - precast panels.
2013 Note:
Section Losses added to top flanges of G1, G6 and G7 of Location 1(South bound span 1) on 7/31/13. These losses measured after deck was removed for replacement.
Original Comments:
Built underFIC 64-7. Deck rehabbed SB 1984 under D250712; NB 1988 D500578
Note: Parapets removed in 2007 under D259742.
This three span bridge is two separate, identical structures side by side, therefor this model has 6 spans (Location 1,2,3,4,5,6).
Updated by R3. 12/05/2011.

Description

SUBSTRUCTURE NOTES

1. TOP OF BACKWALLS ON WHICH ASBESTOS SHEET PACKING IS TO BE PLACED SHALL BE STEEL TROWEL FINISHED.
2. BITUMINOUS MATERIAL, ITEM 61, SHALL BE APPLIED TO THE BACKS OF ALL ABUTMENTS AND WINGWALLS ABOVE TOP OF FOOTINGS, WHERE FILL IS IN CONTACT WITH THE WALLS.
3. EPOXY PROTECTIVE COATING FOR CONCRETE SHALL BE APPLIED TO THE FOLLOWING SURFACES:
   ABUTMENTS - ALL EXPOSED PEDESTAL SURFACES, BRIDGE SEATS; EXPOSED VERTICAL SURFACES OF BACKWALL AND CURTAIN WALLS FACING THE SUPERSTRUCTURE.
   PIERS - ALL PEDESTAL SURFACES AND THE TOP SURFACES OF PIER BETWEEN PEDESTALS INCLUDING THE EDGE CHAMFER AT TOP EDGE OF PIER.
4. THE MAXIMUM FOUNDATION PRESSURES FOR DESIGN PURPOSES: ABUTMENT - 1.5 TONS PER SQUARE FOOT; PIER - 5 TONS PER SQUARE FOOT.
5. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FOR REINFORCING STEEL IN THE SUBSTRUCTURE SHALL BE AS FOLLOWS:

FOOTINGS (INCLUDING UNFORMED BOTTOM)	3"
WALLS ABOVE FOOTINGS	2"
BEAMS AND COLUMNS OF PIERS	2"

6. ITEM 83TX TO BE USED ONLY WHERE DEPTH OF EXCAVATION EXCEEDS 5 FEET.

NOTES:
1. TOP OF BACKWALL IS HORIZONTAL WITHIN THE AREAS MARKED "H", AND SLOPED WITHIN THE AREAS MARKED "S".
2. TYPICAL ABUTMENT SECTION, TYPICAL WING WALL SECTION AND WING WALL ELEVATION ARE SHOWN ON DWG. NO. F-7.
3. SECTION A-A AND DETAILS OF JOINTS AND CATCH BASIN ARE SHOWN ON DWG. NO. F-8.
4. ADDITIONAL PAYMENT ITEMS AND LIMITS FOR ABUTMENT AND WING WALLS ARE SHOWN ON DWG. NOS. F-2, F-4 & F-7.
5. FOR SPACING OF RAILING POSTS AND RAILING DETAILS SEE DWG. NOS. F-17 & F-18.

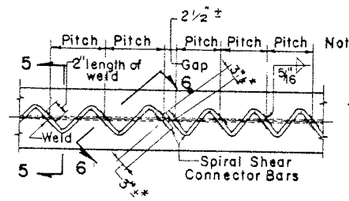
BEARING DETAILS

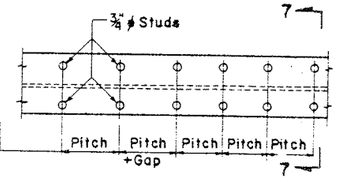


PARTIAL PLAN OF SPIRAL

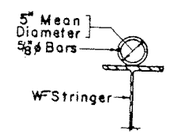
Note: Do not paint surface of flanges on which welds are made

*: Spiral to extend 3"± beyond ℄ of web

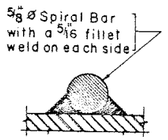
Studs to be spaced at the same pitches shown for the pitch of the spirals



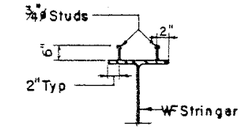
PARTIAL PLAN OF STUDS



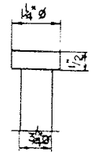
SECTION 5-5



SECTION 6-6



SECTION 7-7



DETAIL OF STUD

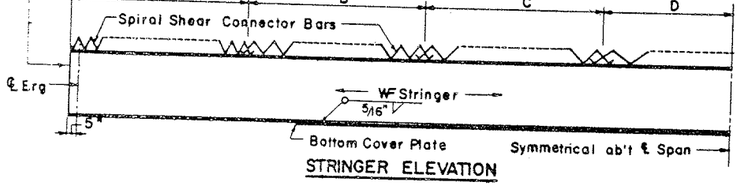
Studs to be used if Contractor so elects.

DETAIL OF SHEAR CONNECTOR
(Item 28C)

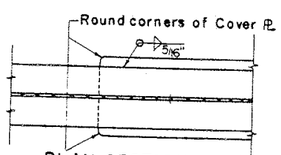
NOTE:
UNLESS OTHERWISE NOTED ALL STEEL SHOWN ON THIS DRAWING WILL BE PAID FOR UNDER ITEM 29.

NOTES:
1. THE CONTRACTOR'S ATTENTION IS CALLED TO THE POSSIBILITY OF INTERFERENCE BETWEEN THE REINFORCING STEEL IN THE SLAB AND THE BEAM SPIRALS. TO AVOID THIS INTERFERENCE THE BAR SPACING MAY BE VARIED 1"± WITH THE UNDERSTANDING THAT THE REQUIRED AREA OF STEEL WILL BE PLACED IN EACH 5'-0". EVEN THEN SOME BARS MAY HAVE TO BE THREADED THROUGH ONE OR MORE SPIRALS.
2. SPECIAL PRECAUTIONS MUST BE EXERCISED WHERE WELDING CROSSES EDGE OF FLANGE TO AVOID ANY POSSIBILITY OF "UNDERCUT" OR NICKS IN EDGE OF FLANGE.

Ends of Stringers to be vertical under full dead load



STRINGER ELEVATION



PLAN SECTION AT END OF COVER PLATE

SUPERSTRUCTURE NOTES:
1. ALL BEARINGS ARE TO BE FIELD WELDED TO BEAMS.
2. SAFETY WALK SHALL NOT BE SCORED.
3. ALL STRUCTURAL STEEL SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATION A7 UNLESS OTHERWISE NOTED.
STEEL BASE METAL TO BE WELDED SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATION A-373.
HIGH STRENGTH BOLTS, NUTS AND WASHERS SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATION A-325.
ALL STRUCTURAL STEEL, REGARDLESS OF TYPE, WILL BE PAID FOR UNDER ITEM 29
STRUCTURAL STEEL, A. S. T. M. DESIGNATION A36-62T MAY BE USED AS A SUBSTITUTE FOR A7 OR A373 WHERE SUCH A36-62T STEEL IS TO BE WELDED, MINIMUM PREHEAT AND INTERPASS TEMPERATURES SHALL BE MAINTAINED FOR WELDING IN ACCORDANCE WITH THE FOLLOWING TABLES:

THICKNESS OF THICKEST PART AT POINT OF WELDING	MINIMUM PREHEAT AND INTERPASS TEMPERATURES
TO 1" INCL.	NONE*
OVER 1" TO 2" INCL.	50°F*
OVER 2"	150°F

*WHEN BASE METAL TEMPERATURES ARE BELOW 32°F PREHEAT BASE METAL TO AT LEAST 70°F AND MAINTAIN DURING WELDING.
WHERE SUCH A36-62T STEEL IS TO BE WELDED, LOW HYDROGEN TYPE ELECTRODES, CONFORMING TO A. W. S. - A. S. T. M. SPECIFICATION FOR MILD STEEL ARC WELDING ELECTRODES CLASSIFICATION E7015, E7016 & E7018, SHALL BE USED.
4. TO INSURE UNIFORM GRADES FOR THE SURFACE OF ROADWAY UNDER DEAD LOAD, AFTER ALL SUPERSTRUCTURE STEEL HAS BEEN ERECTED AND BRACED IN ITS FINAL POSITION, ELEVATION SHALL BE TAKEN ON THE TOP OF THE STEEL AT THE CENTER LINE OF WEB AT EACH CENTER LINE OF BEARING, CENTER OF THE SPAN AND AT OTHER LOCATIONS WHERE THEORETICAL BOTTOM OF THE SLAB ELEVATIONS ARE INDICATED ON THE PLANS.
THE DEPTH OF HAUNCH REQUIRED TO POSITION THE SLAB FORMS WILL BE EQUAL TO THE DIFFERENCE IN ELEVATION BETWEEN THE BOTTOM OF SLAB ELEVATIONS AND THE TOP OF STEEL ELEVATIONS PLUS THE DEFLECTION DUE TO SUPERIMPOSED DEAD LOAD.
5. IF THE CONTRACTOR ELECTS TO USE CORRUGATED METAL FORMS FOR THE STRUCTURAL SLAB, THE DETAILS OF THESE FORMS SHALL BE SUBMITTED TO THE DEPUTY CHIEF ENGINEER (BRIDGES) FOR APPROVAL, PRIOR TO THEIR USE. THE CONTRACTOR'S ATTENTION IS DIRECTED TO ADDITIONAL NOTES APPEARING IN THE PROPOSAL RELATIVE TO CORRUGATED METAL FORMS.
6. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FOR REINFORCING STEEL IN THE SUPERSTRUCTURE SHALL BE AS FOLLOWS:

BRIDGE SLAB - TOP OF SLAB	2"
BRIDGE SLAB - BOTTOM OF SLAB	1"
BRIDGE SLAB - EXTERIOR FACE	2-1/2"
EXTERIOR FACE OF PARAPET	2-3/4"
INTERIOR FACE OF PARAPET	2"

7. MAROON PRIMER, ITEM M18B, WILL NOT BE APPROVED FOR USE ON THIS CONTRACT.
8. FILLET WELDING ACROSS FLANGES WHICH CARRY TENSILE STRESSES SHALL ONLY BE PERFORMED WITH THE MINIMUM PREHEAT OF 200°F

PARTIAL ELEVATION OF RAILING AND PARAPET

SCALE: 3/4" = 1'-0"

CONSTRUCTION PROCEDURE:

1. POUR SLAB.
2. SET STONE CURBS (GRANITE) & POUR SAFETY WALKS TO PROPER LINE AND GRADE. SAFETY WALK NOT TO BE SCORED.
3. SET RAILING ANCHOR BOLTS BY MEANS OF TEMPLATE AND POUR PARAPET. ERECT RAILING.
4. ANCHOR BOLTS SHALL BE CUT OFF 1/8" ABOVE NUT AND PEENED. THE CUT TOPS SHALL BE PAINTED AS REQUIRED BY THE SPECIFICATIONS FOR M 18A, EXCEPT THAT THE FINAL TWO (2) COATS SHALL BE ALUMINUM PAINT COMPLYING WITH THE SPECIFICATIONS FOR M 18J.

RAILING NOTES

1. FOR COMPOSITION OF ALUMINUM ALLOY POSTS, RAILS, SET SCREWS AND SHIMS SEE SPECIAL SPECIFICATION FOR ITEM 37AL1
2. UNLESS OTHERWISE SPECIFIED THE FOLLOWING REQUIREMENTS SHALL BE MAINTAINE

DRAFT ANGLES	= 3°
CORNER RADII	= 1/8"
FILLETS	= 1/2"R
CASTING TOLERANCES	= ± 1/16"
WALL THICKNESS	= ± 1/32"

GATES RISERS AND SEAMS TRIMMED FLUSH

3. BEVELED CAST ALUMINUM SHIMS MAY BE REQUIRED TO OBTAIN PROPER ALIGNMENT. THE COST OF FURNISHING AND PLACING THESE SHIMS SHALL BE INCLUDED IN THE UNI PRICE BID FOR THE RAILING ITEMS.
4. ALL RAILING POSTS OF THE SINGLE RAIL TYPE RAILING SHALL BE SET PERPENDICUL TO THE TOP OF THE PARAPET.
5. RAILINGS ARE TO BE ERECTED SO THAT THE RAIL IS PARALLEL TO THE TOP OF THE AND THE POSTS ARE PERPENDICULAR TO THE TOP OF THE PARAPET. SINCE THE FINISHED RAILINGS MUST MEET ALL REQUIREMENTS OF FIT, ALINEMENT AND GRADE TO THE FULL SATISFACTION OF THE ENGINEER, IT IS SUGGESTED THAT COMPLETE FIELD MEASUREMENTS BE MADE BEFORE ANY SHOP FABRICATION W IS PERFORMED. ANCHOR BOLTS, NUTS AND WASHERS FOR THE RAILING WILL BE PAI FOR UNDER STRUCTURAL STEEL - ITEM 29.

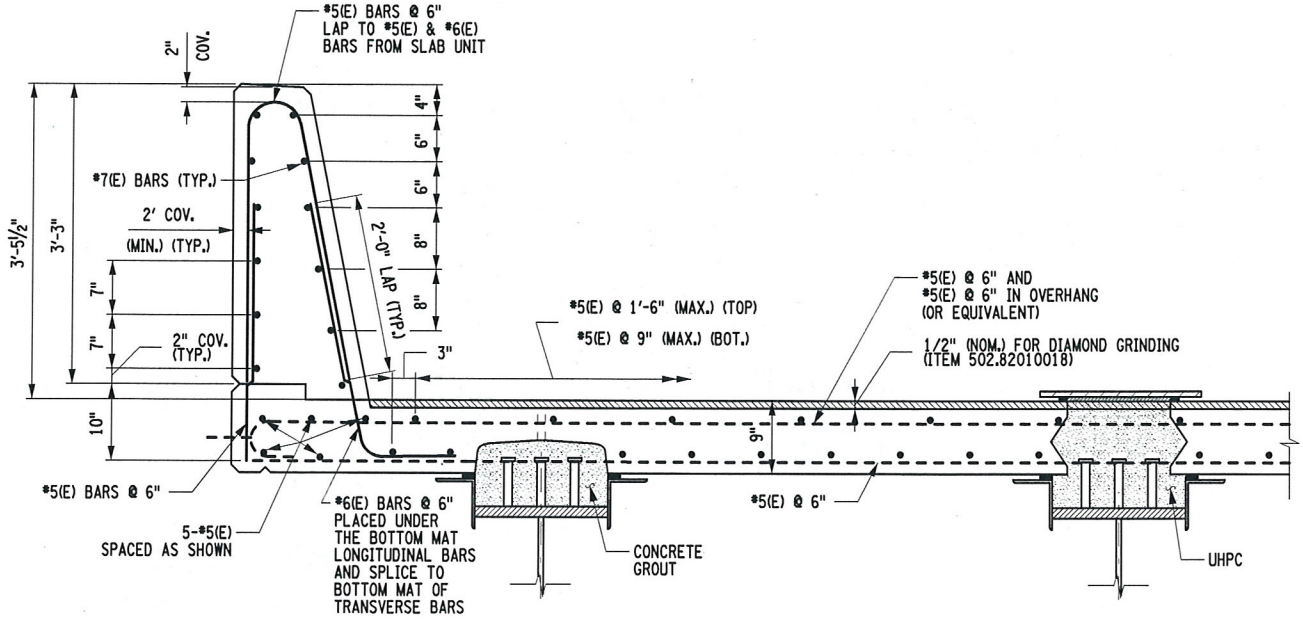
PRECAST CONCRETE DETAILS

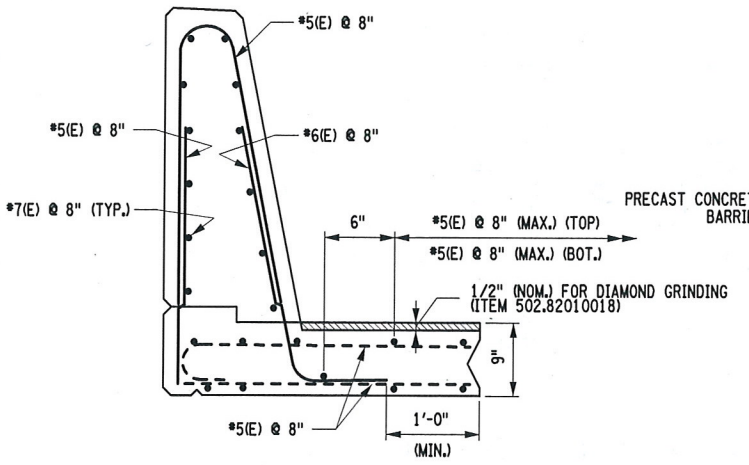
Revised 2013

2013

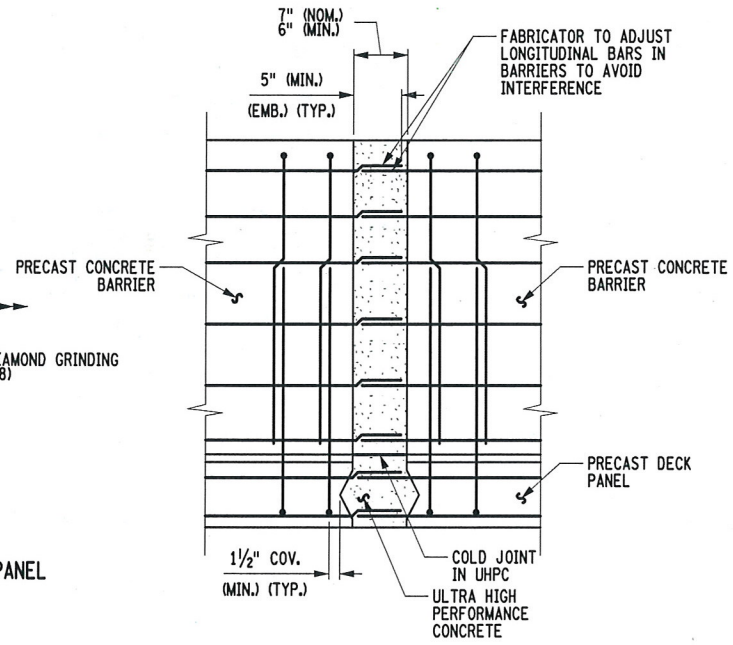


PRECAST BARRIER ON PRECAST BRIDGE DECK PANEL

NOTE: PANEL JOINT LOCATION SHOWN IS FOR ILLUSTRATIVE PURPOSES ONLY. ACTUAL JOINT LOCATION SHALL BE DETERMINED BY THE FABRICATOR.



PRECAST BARRIER ON PRECAST APPROACH SLAB PANEL



ELEVATION
TYPICAL UHPC BARRIER JOINT

NOTES:

FINAL COVER FOR STEEL REINFORCEMENT IN PRECAST PANELS SHALL BE 2" (MIN.) FOR TOP MAT AND 1½" FOR BOTTOM MAT.

(E) - DENOTES EPOXY COATED REINFORCEMENT

FOR OVERALL BARRIER DIMENSIONS, SEE THE "SINGLE SLOPE BARRIER" DETAILS IN THE APPROPRIATE BD'S.

THE SIZE AND NUMBER OF STUD SHEAR CONNECTORS VARIES. SEE BIN SPECIFIC CONTRACT DOCUMENTS FOR INFORMATION.

THE UHPC JOINTS IN THE BARRIER SHALL BE SMOOTH AND FLUSH WITH THE BARRIER SURFACE.

~~D262027~~

PRECAST CONCRETE DETAILS

WHEN THE SLEEPER SLAB DETAIL IS NEEDED UNDER AN APPROACH SLAB WITH A CONCRETE BARRIER ATTACHED TO IT, THE SLEEPER SLAB SHALL BE FROM FACE OF BARRIER TO FACE OF BARRIER.

PRECAST SLEEPER SLAB DETAIL

NOTES:

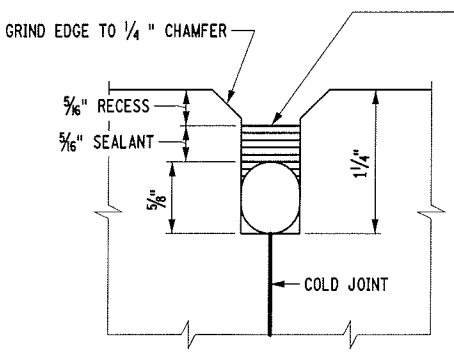
A. EXCAVATION FOR SLEEPER SLABS SHALL BE CAREFULLY MADE AFTER COMPACTED ABUTMENT EMBANKMENT IS IN PLACE. THE SLEEPER SLABS SHALL BE FOUNDED ON UNDISTURBED COMPACT MATERIAL OR RE-COMPACTED MATERIAL. NO LOOSE BACKFILL SHALL BE ALLOWED. THE CONTRACTOR SHALL TAKE ALL NECESSARY PRECAUTIONS TO PROTECT THE SLEEPER SLAB FROM TEMPORARY LOADINGS OR ANY CONDITION WHICH COULD CAUSE MOVEMENTS OR UNEVEN SETTLEMENT OF THE SLEEPER SLAB.

B. TOP OF SLEEPER SLABS SHALL BE STEEL TROWEL FINISHED AND COATED WITH A 0.04 in. NOMINAL THICKNESS OF PERFORMANCE GRADE ASPHALT AS INDICATED IN THE PROPOSAL, OR MATERIAL SPECIFICATION 702-3101. THE TOP OF SLEEPER SLABS SHALL FOLLOW THE CROSS SLOPE AND GRADE OF ROADWAY. COST TO BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB ITEM.

C. IF A MODULAR JOINT SYSTEM IS USED, CONCRETE FURNISHED AND PLACED IN THE RECESSES FOR INSTALLING THE JOINT SYSTEM SHALL COMPLY WITH THE SPECIFICATIONS FOR THE APPROACH SLAB ITEM, EXCEPT THAT MACHINE FINISHING WILL NOT BE REQUIRED. NO ADDITIONAL PAYMENT WILL BE MADE FOR FURNISHING AND PLACING THIS CONCRETE AS THIS QUANTITY LIES WITHIN THE LIMITS OF THE AREA TO BE PAID FOR UNDER THE APPROACH SLAB ITEM. IF AN ARMORLESS JOINT IS USED, PAYMENT FOR THE ELASTOMERIC CONCRETE HEADERS SHALL BE INCLUDED IN THE ITEM FOR THE JOINT SYSTEM. THE JOINT SYSTEM SHALL BE PAID FOR UNDER ITS APPROPRIATE ITEM.

D. COMPRESSED SYNTHETIC SHEET GASKET, MATERIAL SPECIFICATION 728-06 (TWO 1/16" THICK SHEETS. TREATED BOTH SIDES) SHALL BE PLACED WITH PRECAST UNITS. SHIM AND GROUT AS CALLED FOR ON THE BACKWALL DETAILS. PRICE WILL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB ITEM.

E. PAYMENT FOR SLEEPER SLAB EXCAVATION SHALL BE INCLUDED IN THE APPROACH SLAB ITEM.



FILL THE RECESS WITH A STRUCTURAL JOINT MATERIAL, SILICONE SEALANT, FROM THE DEPARTMENT'S APPROVED LIST FOR ITEM 567.51--16. IF THE RECESS IS SAW CUT, WATER BLAST IMMEDIATELY FOLLOWING CUTTING TO REMOVE ANY RESIDUAL SLURRY BEFORE IT DRIES. CLEAN THE VERTICAL FACES OF THE RECESS BY ABRASIVE BLAST AND AIR BLOW THE RESIDUE FROM THE RECESS. PRIME THE VERTICAL FACES WITH THE MANUFACTURER'S RECOMMENDED PRIMER, AND ALLOW TO DRY. PLACE A 5/8" DIA. SOFT CLOSED CELL BACKER ROD IN THE BOTTOM OF RECESS. POUR THE SILICONE SEALANT TO A DEPTH OF APPROX. 5/16". PAYMENT TO BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB.
