TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JUNE 4, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031529 (I-81/ E Calthrop Av)

This memorandum summarizes the seismic screening conducted for BIN 1031529 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JULY 1, 2014

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031529 (I-81 / E Calthrop Ave.)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, End of Bottom Flange Cover Plate	-13.33	74.14
Exterior Girders, End of Bottom Flange Cover Plate	10.88	193.26

NYS DEPT. OF TRANSPORTATION **SHEET: 1 OF 4**
BRIDGE INSPECTION REPORT **BIN: 1031549** **DATE: 4/1/2014**

FEATURE CARRIED: I-81 **TEAM LEADER: G. STAM & A. THOMPSON**
FEATURE CROSSED: EAST COLVIN STREET **ASSIST.TEAM LEADER: T. OLMSTEAD & M. SAVINO**

ITEM	REMARKS	PHOTO NO.
	GENERAL NOTE The bridge structural deck was rated "4" in the 2013 Biennial Inspection, therefore, the deck is not in scope of this In-depth Inspection. The inspection of remaining topside elements performed by A. Thompson & M. Savino. The underside inspection performed by G. Stam & T. Olmstead.	
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: There is a 10' length in the NB center and right lanes that has a previously repaired begin joint header which cracked and spalled along the end (Photo 1). The spalling is up to 5" wide and 1" deep, and the cracking is hairline. This causes impact from vehicles. There is a 1' length of foam joint filler missing to the left of the repaired header. The remainder of the NB joint is in good condition. The SB begin header has settled 1" max. at the centerline of travel way causing impact from vehicles (Photo 2). There is also a ½" gap and elevation difference between the begin header and begin approach pavement. There is no joint visible below deck.	1,2
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion. The left fascia bearing B1 (Photo 3) and bearing B9 (Photo 4) have cracked and peeling paint; and are rusted. The remaining bearings are in better condition (Photo 5). All the bearings are in their normal slightly contracted position at 45 ºF. All the bearings show evidence of movement and appear to be functioning normally.	3,4,5
TP 349-26	Begin Abutment - Seat and Pedestals: The seats are in good condition with no significant cracks or hollow sounding areas detected. Pedestals P7, P8, & P13 have small areas of hollowness at the top middle of the front face (Photo 6). Pedestals P9 & P16 have vertical hairline cracks in the front face. The remainder of the pedestals are in good condition with no significant cracks or hollow areas noted. See the Begin Abutment Deterioration Sketch.	6
TP 349-28	Begin Abutment – Backwall: There are areas of tight mapcracking covering 50% of the surface area of the backwall. The worst areas are the fascia bays, bays 1 & 2 and the median bay between girders G8 and G9 (Photos 7, 8, & 9). The deteriorated areas are illustrated on the Begin Abutment Deterioration Sketch. The significant areas are noted below:	7,8,9
	• Top left fascia bay - spalled 18 inches wide x 10 inches high x 2 inches deep with exposed rusted reinforcement that is mostly bonded (Photo 7). The remainder of the bay is cracked with seepage and heavy efflorescence.	7
	• Bay 1 – 3 square feet area of hollow sounding concrete; a 6 inches diameter x 2 inches deep spall with an exposed rusted reinforcement bar; horizontal cracking along the top of the bay with staining; and a full height vertical crack with efflorescence (Photo 10).	10
	• Bay 2 – horizontal cracking along the top with 2 square feet of hollow sounding area; and several vertical hairline cracks with staining and efflorescence (Photo 8).	8
	• Bay 4 – 2 square feet area of hollow sounding, cracked and delaminated concrete with spalling along the edges (Photo 11).	11

ITEM	REMARKS	PHOTO NO.
TP 349-30	Begin Abutment – Stem: The stem has been recently repaired and is in generally good condition. The left side is tight mapcracked in a previously patched area (Photo 12). There are scattered areas of tight mapcracking, and hairline cracks; a hollow area, and a small spall as illustrated on Begin Abutment Deterioration Sketch.	12
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: There is a 4' length in the SB center lane that has a previously repaired end joint header (Photo 13). The header is in good condition. There is +/-1/2" of settlement in the left half of the left lane causing impact from vehicles. The foam joint filler is in good condition except for a 2' width at the header repair where it is coming up. There is a 1' dia. x 2" deep pothole in the end approach at the right edge of the center lane adjacent to the header (Photo 14). The end joint in the NB travel way is in good condition. There is no joint visible below deck.	13,14
TP 349-25	End Abutment – Bearings: The end bearings are fixed. The fascia bearings G1 & G16 are rusted (Photos 15 & 16). The interior bearings are in better condition except bearing B9 adjacent to the median in the structure which allows leakage onto the bearing B9 below (Photo 17).	15,16,17
TP 349-27	End Abutment - Seats and Pedestals: The seats are in good condition with no significant cracks or hollow areas detected. Pedestal P1 is damp and there is a hairline crack on the right side (Photo 18). Pedestals P3 & P4 have cracks with staining on the front faces and the right sides (Photos 19 & 20). The remainder of the pedestals are in good condition with no significant cracks or hollow areas detected.	18,19,20
TP 349-29	End Abutment – Backwall: There are areas of hairline mapcracking covering 50% of the surface area of the backwall. The worst areas are the left fascia bay, bay 1, bay 7, and the right fascia bay (Photos 18, 21, & 22). At the top of the left fascia bay, there is a 6 inches wide x 1 foot high x 4 inches deep spall (Photo 23). There is crumbly concrete and a 0.5 square foot area of hollow sounding concrete surrounding the spall with seepage and heavy efflorescence down the backwall. In bay 8, on the right side, there is cracking with heavy staining; and on the left side, at the top, there is a 6 inches wide x 6 inches high x 2 inches deep spall with damp crumbly concrete; and seepage with heavy efflorescence down the backwall (Photo 24). In bay 12, there is a vertical hairline crack with efflorescence (Photo 25). See the End Abutment Deterioration Sketch.	18,21,22 23,24,25
TP 349-31	End Abutment – Stem: The stem has a patchwork of various vintages of repairs. Toward the right side, there is an area of tight mapcracking of a patched area (Photo 26). Beneath girder bay 2, there is cracking, shallow surface scaling and several hollow sounding areas (Photo 27). At mid-span, there is full height vertical cracking with staining and a 5.5 square foot area of hollow sounding concrete (Photo 28). There are scattered cracks and hollow areas as illustrated on the End Abutment Deterioration Sketch.	26,27,28

ITEM	REMARKS	PHOTO NO.
	APPROACH ITEMS No approach item deficiencies are noted.	
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride on the deck is smooth.	
TP 350-20	Deck – Curbs: The granite curbs at the left and right are in good condition. There are no curbs at the median.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – The bridge does not have sidewalks.	
	Fascias – The left fascia has tight map cracking over 10% of the surface, primarily beneath the railing posts; and scattered staining spots (Photo 29). Also, there are scattered vertical hairline cracks (Photo 30). The right fascia has light scattering of tight mapcracking.	29,30
TP 350-22	Deck - Railings: The bridge has concrete parapets with steel railings on top at the left and right and jersey barrier along the center. The end left bolt at the second railing post from the end on the left side railing is sheared off (Photo 31). The remainder of the railings are in good condition. The left parapet is map cracked for its entire length (Photo 32). The right parapet has several sections that have been replaced totaling about 1/3 of the total length (Photo 33). The replaced sections are in good condition. The original sections are map cracked throughout. The center jersey barrier has map cracking on both faces (Photo 34).	31,32,33 34
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: The structural deck was not included in this inspection.	
TP 350-28	Primary Members: There is localized corrosion at the end left side of girder G1 above the bearing. Caliper measurements taken over a 1.75 inches wide x 1 inch high area of the web above the rear portion of the bearing shows a 42% section loss (Photo 35 & 15). There is similar, but less severe, localized corrosion at the end right side of girder G16 (Photo 16). The remaining primary members are in good condition with only surface rusting where the paint has blistered or peeled (Photo 36). No other significant section losses were noted.	15,16,35 36
	There are utility support angles welded to the top of the bottom flanges of all girders except girder G16. Broken welds were noted at the begin angle at the right side of G1 (Photos 37 & 38); and the end angle at the right side of girder G3 (Photos 39 & 40). The welds are completely broken and no cracks into the primary member base metal were detected.	37,38 39,40
TP 350-29	Secondary Members: The secondary members (diaphragms) are in good condition with only surface rusting where the paint has blistered or peeled. No significant section loss was noted.	

ITEM	REMARKS	PHOTO NO.
TP 350-30	Paint: The paint system is failed on approximately 5% of the surfaces of the girders and diaphragms (Photo 36). There is cracking and peeling of the paint on the bottom flanges (Photos 41 & 42). There is surface rusting where the paint has peeled or blistered. The webs of the left side of girder 9 and the outside of right fascia girder G16 have scattered freckling, blistering and peeling paint (Photo 42 & 43). The remaining paint is faded and chalky. **UTILITIES ITEMS**	36,41,42 43
TP 350-43	Lighting: The light pole for I81 is in good condition (Photo 44).	44
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: There are lighting utility conduits attached to the outside of both parapets (Photos 29 & 45). **SPECIAL EMPHASIS ITEMS** Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – Yes. Specified below. Special Emphasis Details · Partial length cover plates on girders G2 thru G8 and G10 thru G15. · Lighting junction box support angles welded to the web of girder G1 in a tension zone below the neutral axis. · Utility support welded connections to bottom flanges of girders. G1 thru G15.	29,45

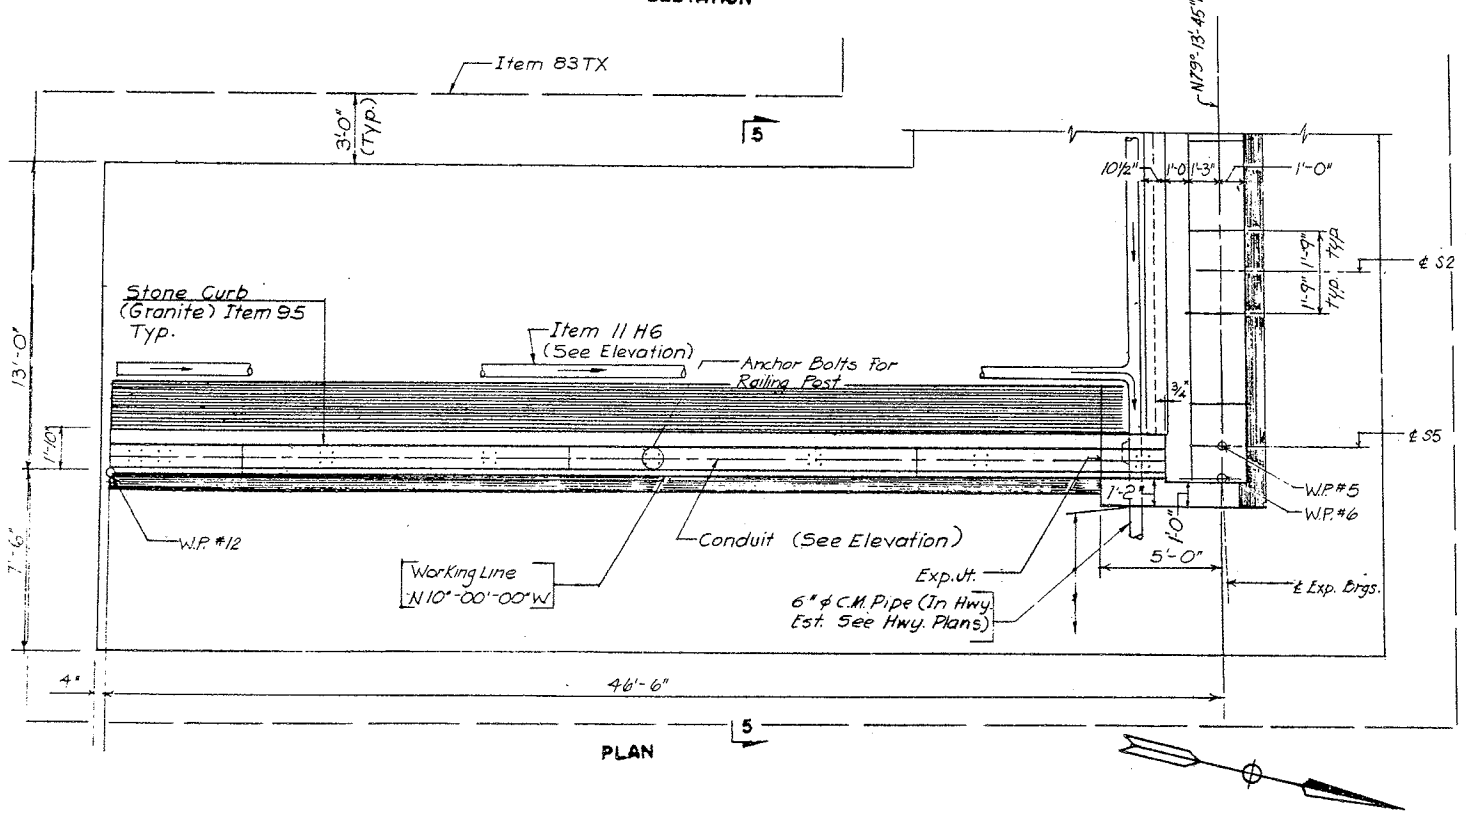
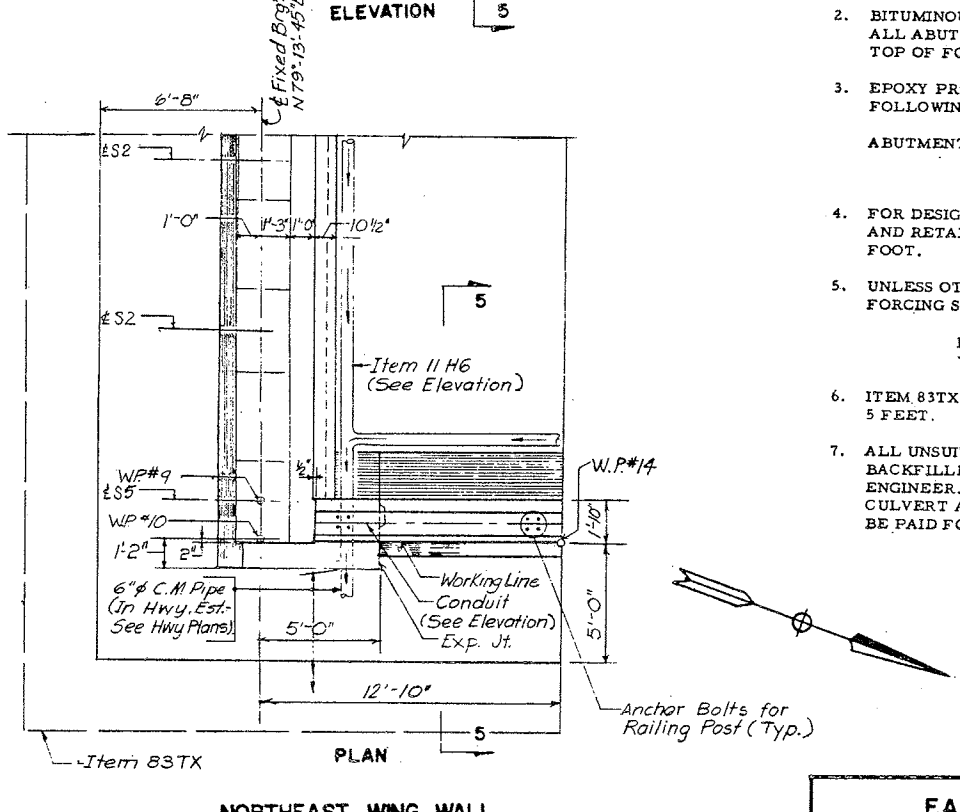
5. ADDITIONAL PAYMENT ITEMS AND LIMITS FOR ABUTMENTS AND WING ARE SHOWN ON DWGS. NO. J-2 & J-5.
6. SEE DWGS. NO. J-4 AND J-25 FOR RAILING POST SPACING AND RAILINC
7. SEE DWG. NO. J-19 FOR ADDITIONAL JOINT DETAILS.



SOUTHEAST WING WALL
SCALE: 1/4" = 1'-0"



NORTHEAST WING WALL
SCALE: 1/4" = 1'-0"

SUBSTRUCTURE & RETAINING WALL NOTES

1. TOP OF BACKWALLS OF ABUTMENTS ON WHICH ASBESTOS SHEET IS TO BE PLACED SHALL BE STEEL TROWEL FINISHED.
2. BITUMINOUS MATERIAL, ITEM 61, SHALL BE APPLIED TO THE BA ALL ABUTMENTS, WINGWALLS, AND RETAINING WALLS "F" & "G TOP OF FOOTINGS TO THE LIMITS AS SHOWN ON PAYMENT LIMIT
3. EPOXY PROTECTIVE COATING FOR CONCRETE SHALL BE APPLIE FOLLOWING SURFACES:

   ABUTMENTS - ALL EXPOSED PEDESTAL SURFACES, BRIDGE SEAT VERTICAL SURFACES OF BACKWALL AND CURTAIN FACING THE SUPERSTRUCTURE..
4. FOR DESIGN PURPOSES THE FOUNDATION PRESSURE OF BOTH AB AND RETAINING WALLS "F" & "G" DOES NOT EXCEED 2 TONS PER FOOT.
5. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FO FORCING STEEL IN THE SUBSTRUCTURE SHALL BE AS FOLLOWS:

   FOOTINGS (INCLUDING UNFORMED BOTTOM) 3"
   WALLS ABOVE FOOTINGS 2"
6. ITEM 83TX TO BE USED ONLY WHERE DEPTH OF EXCAVATION EX 5 FEET.
7. ALL UNSUITABLE MATERIAL UNDER FOOTINGS SHALL BE REMOV BACKFILLED WITH SELECTED GRANULAR FILL AS ORDERED BY T ENGINEER. THE EXCAVATION SHALL BE PAID FOR UNDER TRENC CULVERT AND BRIDGE EXCAVATION (ITEM 5) AND THE BACKFILL BE PAID FOR UNDER SELECTED GRANULAR FILL (ITEM 2EF-B).

J.P.M.

SLAB CONSTRUCTION PROCEDURE

1. POUR SLAB.
2. SET STONE CURBS (GRANITE) & POUR LOWER PORTION OF PARAPET TO PROPER LINE AND GRADE.
3. SET RAILING ANCHOR BOLTS BY MEANS OF TEMPLATE AND POUR PARAPET. ERECT RAILING.
4. ANCHOR BOLTS SHALL BE CUT OFF 1/8" ABOVE NUT AND PEENED. THE CUT TOPS SHALL BE PAINTED AS REQUIRED BY THE SPECIFICATIONS FOR M 18A, ESCEPT THAT THE FINAL TWO (2) COATS SHALL BE ALUMINUM PAINT COMPLYING WITH THE SPECIFICATIONS FOR M 18J.

NOTES:
1. UNLESS OTHERWISE NOTED ALL STEEL SHOWN ON THIS DRAWING SHALL BE PAID FOR UNDER ITEM 29.
2. ALL BAR REINFORCING SHOWN ON THIS DRAWING SHALL BE PAID FOR UNDER ITEM 28.
3. FOR RAILING, PARAPET AND CURB DETAILS SEE DWG. NO. J-25.

SUPERSTRUCTURE NOTES

1. ALL BEARINGS ARE TO BE FIELD WELDED TO BEAMS.
2. UNLESS OTHERWISE NOTED, ALL STRUCTURAL STEEL SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATION A36-62T.
3. HIGH STRENGTH BOLTS, NUTS AND WASHERS SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATION A-325. ALL STRUCTURAL STEEL, REGARDLESS OF TYPE, WILL BE PAID FOR UNDER ITEM 29.
3. MINIMUM PREHEAT AND INTERPASS TEMPERATURES SHALL BE MAINTAINED FOR WELDING IN ACCORDANCE WITH THE FOLLOWING TABLES:

THICKNESS OF THICKEST PART AT POINT OF WELDING	MINIMUM PREHEAT AND INTERPASS TEMPERATURES
TO 1" INCL.	NONE*
OVER 1" TO 2" INCL.	50°F*
OVER 2"	150°F

*WHEN BASE METAL TEMPERATURES ARE BELOW 32°F PREHEAT BASE METAL TO AT LEAST 70°F AND MAINTAIN DURING WELDING.

4. TO INSURE UNIFORM GRADES FOR THE SURFACE OF ROADWAY UNDER DEAD LOAD, AFTER ALL SUPERSTRUCTURE STEEL HAS BEEN ERECTED AND BRACED IN ITS FINAL POSITION, ELEVATION SHALL BE TAKEN ON THE TOP OF THE STEEL AT THE CENTE LINE OF WEB AT EACH CENTER LINE OF BEARING, CENTER OF THE SPAN AND AT OTHER LOCATIONS WHERE THEORETICAL BOTTOM OF THE SLAB ELEVATIONS ARE INDICATED ON THE PLANS. THE DEPTH OF HAUNCH REQUIRED TO POSITION THE SLAB FORMS WILL BE EQUAL TO THE DIFFERENCE IN ELEVATION BETWE THE BOTTOM OF SLAB ELEVATIONS AND THE TOP OF STEEL ELEVATIONS PLUS THE DEFLECTION DUE TO SUPERIMPOSED DEA LOAD.
5. LOW HYDROGEN TYPE ELECTRODES, CONFORMING TO A. W. S. -A. S. T. M. SPECIFICATION FOR MILD STEEL ARC-WELDING, ELECTRODES, CLASSIFICATION E 7015, E 7016 & E 7018.
6. IF THE CONTRACTOR ELECTS TO USE CORRUGATED METAL FORMS FOR THE STRUCTURAL SLAB, THE DETAILS OF THESE FOR SHALL BE SUBMITTED TO THE DEPUTY CHIEF ENGINEER (BRIDGES) FOR APPROVAL, PRIOR TO THEIR USE. THE CONTRACTOR ATTENTION IS DIRECTED TO ADDITIONAL NOTES APPEARING IN THE PROPOSAL RELATIVE TO CORRUGATED METAL FORMS.
7. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FOR REINFORCING STEEL IN THE SUPERSTRUCTURE SHALL BE AS FOLLOWS:

BRIDGE SLAB - TOP OF SLAB	2"
BRIDGE SLAB - BOTTOM OF SLAB	1"
BRIDGE SLAB - EXTERIOR FACE	2-1/2"
EXTERIOR FACE OF PARAPET	2-3/4"
INTERIOR FACE OF PARAPET	2"

8. MAROON PRIMER, ITEM M18B, WILL NOT BE APPROVED FOR USE ON THIS CONTRACT.
9. FILLET WELDING ACROSS FLANGES WHICH CARRY TENSILE STRESSES SHALL ONLY BE PERFORMED WITH THE MINIMUM PREHEAT OF 200°F.
10. SAFETY WALKS SHALL NOT BE SCORED.

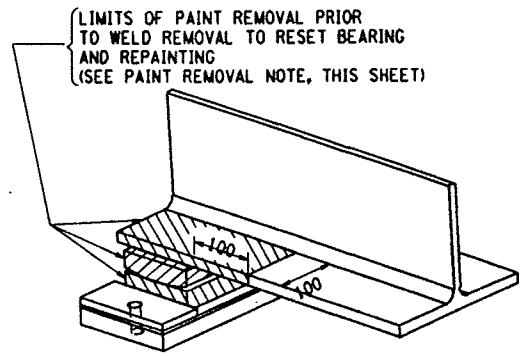
THE CONTRACTOR SHALL PLACE HOLE IN MASONARY ℄ EXTENSION AT LOCATION WHERE A 200mm MINIMUM CLEARANCE FROM THE ℄ OF THE ANCHOR BOLT TO THE EDGE OF THE PEDESTAL CAN BE ACHIEVED. THIS LOCATION SHALL BE APPROVED BY THE ENGINEER.



PAINT REMOVAL DETAIL

NOT TO SCALE

PAINT REMOVAL NOTE:

1. IN CONJUNCTION WITH BEARING RESTORATION THE USE OF ITEM 571.01NNNN M - TREATMENT & DISPOSAL OF PAINT REMOVAL WASTE AND ITEM 570.09NNNN M - ENVIRONMENTAL GROUND PROTECTION SHALL ALSO BE INCORPORATED DURING THE PAINT REMOVAL OPERATIONS.
2. ALL NEW PARTS INSTALLED UNDER BEARING RESTORATIONS SHALL BE INCLUDED IN THE UNIT PRICE BID FOR ITEM 15565.4302 M. REPLACEMENT MATERIALS SHALL BE ASTM A36 EXCEPT AS NOTED.
3. ALL SURFACES SHALL BE CLEANED AND LUBRICATED TO ENSURE FREE MOVEMENT, ITEM 15565.4302 M.

BRIDGE BEARING RESTORATION NOTES:

EXPANSION BEARING RESTORATION WORK (ITEM 15565.4302 M) SHALL INCLUDE THE FOLLOWING:

(1) STRUCTURAL LIFTING UNDER LIVELOAD (PAID FOR UNDER ITEM 585.0X M)
(2) REPLACEMENT OF BRONZE EXP. BEARING ℄
(3) REPLACEMENT OF SHEARED ANCHOR BOLTS AS NEEDED (IF PEDESTAL IS NOT SCHEDULED FOR REPLACEMENT, THE CONTRACTOR HAS TWO OPTIONS:
  1. REMOVE TOP 150 mm OF CONCRETE PEDESTAL AND INSTALL NEW ANCHOR BOLTS WIDEN MASONRY PLATE AS SHOWN IN THE DETAILS (ITEM 580.01 M AND ITEM 555.09 M)
(4) RESET BEARING (IF NEEDED BY CUTTING SOLE ℄ WELDS FROM GIRDER FLANGE & REWELDING)
(5) COMMERCIAL BLAST CLEAN TO NEAR WHITE FINISH
(6) MAINTENANCE PAINTING
(7) BEARING LUBRICATION

FIXED BEARING RESTORATION WORK (ITEM 15565.4302 M) SHALL INCLUDE THE FOLLOWING:

(1) STRUCTURAL LIFTING UNDER LIVELOAD (PAID FOR UNDER ITEM 585.0X M)
(2) REPLACEMENT OF SHEARED ANCHOR BOLTS AS NEEDED (IF PEDESTAL IS NOT SCHEDULED FOR REPLACEMENT, THE CONTRACTOR HAS TWO OPTIONS:
  1. REMOVE TOP 150mm OF CONCRETE PEDESTAL AND INSTALL NEW ANCHOR BOLTS WIDEN MASONRY PLATE AS SHOWN IN THE DETAILS (ITEM 580.01 M AND ITEM 555.09 M)
(3) COMMERCIAL BLAST CLEAN TO NEAR WHITE FINISH
(4) MAINTENANCE PAINTING
(5) BEARING LUBRICATION
NOTE: FIXED BEARINGS SHALL NOT BE DISASSEMBLED UNLESS A.O.B.E.

IF GRINDING REDUCES THE BEARING HEIGHT THEN SHIM DEVICES APPROVED BY THE E.I.C. TO OBTAIN THE ORIGINAL HEIGHT SHALL BE PROVIDED UNDER ITEM 15565.4302 M.

BRIDGE BEARING RESTORATION NOTES:

1. EXPANSION BEARING RESTORATION WORK (ITEM 15565.4302 M) SHALL INCLUDE THE FOLLOWING:
   (1) STRUCTURAL LIFTING UNDER LIVE LOAD (PAID FOR UNDER ITEM 585.0X M)
   (2) REPLACEMENT OF TEFLON PAD (IF NEEDED)
   (3) REPLACEMENT OF SHEARED ANCHOR BOLTS AS NEEDED (IF PEDESTAL IS NOT SCHEDULED FOR REPLACEMENT, REMOVE TOP 150 mm OF CONCRETE PEDESTAL, ITEM 580.01 M AND ITEM 555.09 M)
   (4) RESET BEARING (IF NEEDED BY CUTTING SOLE ℄ WELDS FROM GIRDER FLANGE & REWELDING)
   (5) MAINTENANCE BLAST CLEAN TO REMOVE ALL LOOSE MATERIALS
   (6) BEARING LUBRICATION
2. FIXED BEARING RESTORATION WORK (ITEM 15565.4302 M) SHALL INCLUDE THE FOLLOWING:
   (1) STRUCTURAL LIFTING UNDER LIVE LOAD (PAID FOR UNDER ITEM 585.0X M)
   (2) REPLACEMENT OF SHEARED ANCHOR BOLTS OR NUTS AS NEEDED (IF PEDESTAL IS NOT SCHEDULED FOR REPLACEMENT, REMOVE TOP 150 mm OF CONCRETE PEDESTAL, ITEM 580.01 M AND ITEM 555.09 M)
   (3) MAINTENANCE BLAST CLEAN TO REMOVE ALL LOOSE MATERIALS
   (4) BEARING LUBRICATION
   NOTE: FIXED BEARINGS SHALL NOT BE DISASSEMBLED UNLESS A.O.B.E.

NOTES:

1. IN CONJUNCTION WITH BEARING RESTORATION THE USE OF ITEM 571.01NNNN M - TREATMENT & DISPOSAL OF PAINT REMOVAL WASTE AND ITEM 570.09NNNN M - ENVIRONMENTAL GROUND PROTECTION SHALL ALSO BE INCORPORATED DURING THE CLEANING OPERATIONS.
2. ALL NEW PARTS INSTALLED UNDER BEARING RESTORATIONS SHALL BE INCLUDED IN THE UNIT PRICE BID FOR ITEM 15565.4302 M. REPLACEMENT MATERIALS SHALL BE ASTM A588 EXCEPT AS NOTED.
3. ALL SURFACES SHALL BE CLEANED AND LUBRICATED TO ENSURE FREE MOVEMENT, ITEM 15565.4302 M.
4. ALL WELDING SHALL BE DONE IN ACCORDANCE WITH THE NEW YORK STATE STEEL CONSTRUCTION MANUAL.

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:
BIN 1-03154-9
Interstate Route 81 over Colvin Street

Prepared for:
New York State
Department of Transportation

PIN 3803.99.101

LaBella Project No. 97132

March, 1998

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 81 Bridge over Colvin Street. Based on laboratory analyses of bulk samples collected, the following materials were determined to contain asbestos:

BIN 1-03154-9 Interstate Route 81 over Colvin Street

Type of Material	Estimated Amount
Sheet Packing	23.4 Square Meters
Caulking Compound	1 Linear Meter

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 81 Bridge over Colvin Street (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-03154-9 Interstate Route 81 over Colvin Street

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slabs at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 23.4 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Caulking Compound

Small amounts of asbestos-containing caulking compound are located around a few of the guide rail base plates on both parapets on the bridge.

It is estimated that the total amount of this caulking compound is approximately 1 linear meter. This estimate is based on field observations made at the time of the site visit.

The approximate location of this material is shown in the attached FIGURE 2. Analytical results of bulk samples collected are summarized in the attached TABLE.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: APRIL 25, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031549 (I-81 / E Colvin St)

This memorandum summarizes the seismic screening conducted for BIN 1031549 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JULY 1, 2014

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031549 (I-81 / E Colvin St.)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, End of Bottom Flange Cover Plate	8.55	181.77
Exterior Girders, End of Bottom Flange Cover Plate	12.68	202.11

FEATURE CARRIED: I-81 NB & SB **TEAM LEADER: G. STAM**
FEATURE CROSSED: EAST CASTLE STREET **ASSIST. TEAM LEADER: T. OLMSTEAD**

ITEM	REMARKS	PHOTO NO.
	GENERAL NOTE The entire bridge deck was replaced in 2013 with new precast deck panels. There are no joints at either approach of the bridge and the deck is continuous with the new precast concrete approach panels at the begin and end approaches. There is a sleeper slab at the begin of the begin concrete approach slab. There are joints at piers 1 and 2. The deck elements: curbs, safety walks, and railings; median barrier; and fascias were replaced with precast integral single slope parapets and median barrier.	
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: Top of deck items were not inspected.	
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion. All of the bearings are in generally good condition, however, the bearings are painted and there is no evidence of movement of the bearings at 40 ºF (Photo 1).	1
TP 349-26	Begin Abutment - Seat and Pedestals: There are stub abutments, therefore no seat. Pedestal P1 has concrete or grout overpour on the top (Photo 2). The overpour is hollow sounding throughout. At the right side of the top the underlying pedestal concrete is visible. There is 1.5 square foot area of hollow sounding concrete and the remainder appears sound (Photo 3). The overpour surrounds a portion of the bearing masonry plate; however, it does not impeded movement of the bearing slider or rocker. On the remainder of the pedestals, there are scattered cracks and hollow sounding areas as illustrated on the Begin Abutment Deterioration Sketch (Photo 1).	1,2,3
TP 349-28	Begin Abutment – Backwall: There are scattered cracks and hollow sounding areas as illustrated on the Begin Abutment Deterioration Sketch. Significant areas are noted below: • Left fascia bay - tight mapcracking with 2 square feet of hollow sounding area in a patch at the top (Photo 4). • Pedestal bay 6 - at mid-height, there is 6 square feet of hollow sounding concrete in a patched area (Photo 5). • Pedestal bay 7 – vertical and horizontal cracks, and 1.5 square foot area of hollow sounding concrete (Photo 6).	 4 5 6
TP 349-30	Begin Abutment – Stem: There are stub abutments, therefore no stem.	
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: Top of deck items were not inspected.	

ITEM	REMARKS	PHOTO NO.
TP 349-25	End Abutment – Bearings: The end bearings are fixed. All of the bearings are in generally good condition. The following bolts are leaning slightly (Photo 7): Bearing / Bolt Side / Lean Direction B2 / Right / End B3 / Left / Right B4 / Left / Right B5 / Left & Right / Begin B6 / Left & Right / Begin B8 / Right / End & Right B9 / Left / Right	7
TP 349-27	End Abutment - Seats and Pedestals: There are stub abutments, therefore no seat. At the pedestals, there are scattered mostly hairline cracks as illustrated on the End Abutment Deterioration Sketch (Photo 8). No significant hollow sounding areas were detected.	8
TP 349-29	End Abutment – Backwall: There are scattered cracks and hollow sounding areas on the backwall as illustrated on the End Abutment Deterioration Sketch (Photos 9 & 10).	9,10
TP 349-31	End Abutment – Stem: There are stub abutments, therefore no stem.	
	APPROACH ITEMS - Approach items were not inspected.	
	DECK ITEMS - Deck items were not inspected.	
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Structural deck items were not inspected.	
TP 350-28	Primary Members: The primary members are in good condition (Photo 11). No significant section loss was noted. The web crippling condition at the end of girder G14 in span 1 reported in the 2013 Biennial Inspection has been repaired with a 0.5 inch thick plate welded on the right side of girder G14 over the bearing and a 5 inch x 5 inch angle bolted on the inside stiffener (Photo 12).	11,12
	There are utility support angles welded to the top of the bottom flanges at the begin and ends of all girders except girder G16 in span 2. A broken weld was noted at the begin side of the angle at the begin right side of G6 (Photo 13); and the weld at the end right side of girder G12 (Photos 14 & 15). The welds are completely broken and no cracks into the primary member base metal were detected.	13,14,15
TP 350-29	Secondary Members: The secondary members (diaphragms) are in good condition. No significant section loss was noted.	

ITEM	REMARKS	PHOTO NO.
TP 350-30	Paint: The girders and diaphragms have been recently partially painted. The entire fascia girders; and the interior girder ends and end diaphragms have been painted in all spans (Photos 16, 17 & 11). The top and bottom flanges of the interior girders; and the ends and flanges of the diaphragms in spans 2 and 3 have also been painted. The paint system is in good condition.	11,16,17
TP 350-31	Joints: The top of deck was not inspected. The pier joints are armorless with elastomeric concrete headers and filled elastic material seal. From below deck, the styrofoam joint bond breaker material is hanging down in several bays. The seal material has pulled away from the header with numerous up to 0.5 inch wide gaps allowing runoff to flow down onto the superstructure and substructure elements below. Specific locations are noted below: Pier 1 • Girder bay 2 – there are several gaps in the joint seal allowing sand and runoff to flow onto the bearing B3, pedestal P3 and the cap beam below (Photos 18 & 19). • Girder bay 7 – there is no seal at the median allowing runoff to leak onto the deck panel below (Photo 20). • Girder bay 12 - there are several gaps in the joint seal allowing sand and runoff to flow onto the bearing B13, pedestal P13 and the cap beam below (Photos 21 & 22). Pier 2 • Girder bay 3 – there are several gaps in the joint seal allowing sand and runoff to flow onto the bearing B4, pedestal P4 and the cap beam below (Photo 23). • Girder bay 7 – there is no seal at the median allowing runoff to leak onto the deck panel below (Photo 24). • Girder bay 12 - there are several gaps in the joint seal allowing sand and runoff to flow onto the bearing B13, pedestal P13 and the cap beam below (Photos 25, 26, & 27). The runoff is seeping onto the underside of the end of span 2 deck panels in bays 11 and 12, the top flanges of girders G12 and G13; and the end diaphragm in bay 12 (Photos 28 & 29).	18,19 20 21,22 23 24 25,26,27 28,29
	<u>PIER ITEMS</u>	
TP 350-33	Pier – Bearings: The begin side bearings are fixed and the end side bearings are expansion on both piers. Generally the bearings are in good condition. Typical, the expansion bearings are slightly contracted at 40 ºF and all the bearings show evidence of movement. The following specific conditions were observed: Pier 1 • Expansion bearing B2 – left anchor nut is up off the keeper plate 1 inch (Photo 30). • Expansion bearing B6 – bearing has concrete or group overpour at the begin and right side partially restricting the movement of the bearing slider (Photo 31). • Expansion bearing B7 – right bolt bent toward end. • Expansion bearing B9 – left anchor bolt is up off the keeper plate 1 inch (Photo 32). • Expansion bearing B13 – left anchor bolt is missing (Photo 21). • Expansion bearing B13 – right anchor bolt is up off the keeper plate 0.5 inch.	30 31 32 21

ITEM	REMARKS	PHOTO NO.
	Pier 2	
	• Expansion bearing B7 – right anchor bolt sheared off and dislodged (Photo 33).	33
	• Expansion bearing B13 – end right keeper plate anchor nut up off the keeper plate 1 inch (Photo 26).	26
TP 350-34	Pier – Pedestals: The pedestals have locations of hollow, cracked and spalled concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below: Pier 1	
	• Pedestal P 2 – top left and left side are cracked with 3.5 square feet of hollow sounding concrete (Photo 34).	34
	• Pedestal P3 – cracked on the end face and 1.0 square foot of hollowness at the end and top edge.	
	• Pedestal P5 – end face is cracked with 1 square foot of hollowness and at the top edge an 8 inches wide x 2.5 inches high x 2 inches deep spall with exposed reinforcement (Photo 35). The hollowness extends 1 square foot on the top to the end side bearing masonry plate.	35
	Pier 2	
	• Pedestal P1 – begin left side is cracked along the top edge and vertically (Photo 36).	36
	• Pedestal P4 – cracked on the left side and front face, and 1 square foot of hollow sounding concrete on the front face (Photos 23 & 37).	23,37
	• Pedestal P12 – cracked on the left side.	
	• Pedestal P13 – cracked on the left side of the begin face and begin right edge and side.	
TP 350-37	Pier – Cap Beam: The cap beams have scattered cracks and hollow sounding areas as illustrated on the Pier Deterioration Sketches. Significant areas are noted below: Pier 1	
	• Begin face @ column bay 1 – several vertical hairline cracks at the bottom half of the beam (Photo 38).	38
	• Begin face @ column bay 5 – mapcracking over 50% of the surface (Photo 22).	22
	• End face @ column bay 1 – vertical crack and 2.5 square feet of hollow sounding concrete (Photo 39).	39
	• Under side of column bay 5 – 7 square feet of hollow sounding concrete (Photo 40).	40
	Pier 2	
	• Begin face @ column bay 1 – cracking and 2 square foot area of hollowness near the right side.	
	• Begin face @ column bay 5 – tight mapcracking over 25% of the surface near the right side.	
	• End face @ column bay 1 – tight mapcracking over 25% of the area near the left side and cracking above column C1 (Photo 41).	41
	• End face @ column C4 – 10 inches wide x 8 inches high x 2 inches deep spall with exposed rusted reinforcement at the bottom edge (Photo 42).	42
	• End face @ at Pedestal P9 – cracked with 2 square foot area of hollowness (Photo 43).	43
	• End face @ column bay 5 - tight mapcracking over the right half of the bay (Photo 27).	27

ITEM	REMARKS	PHOTO NO.
	Pier – Columns: The pier columns have scattered cracks and hollow sounding areas as illustrated on the Pier Deterioration Sketches. Significant areas are noted below: Pier 1 • Column C3 @ begin face – a vertical crack with efflorescence at mid height (Photo 44).	44
	Pier 2 • Column C1 @ end face – 4.5 square foot cracked and hollow area at the top half (Photo 45).	45
	• Column C6 @ end face – full height vertical crack with efflorescence (Photo 46).	46
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None visible.	
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required: • Non-Redundant/Fracture Critical Members – No • Pin and Hangers – No • Fatigue-Prone Welds – Yes • Non-Categorized Fatigue-Prone Details – No • Other – Yes. Specified below. Special Emphasis Details: • Partial length cover plates in spans 1 & 3 on girders G2 thru G13; and in span 2 girders G2 thru 8. • Lighting junction box support angles welded to the web in a tension zone below the neutral axis in span 2 girder G2 right side at end. • Utility support welded connections to bottom flanges of span 2 girders G1 thru G15.

SUBSTRUCTURE NOTES

1. TOP OF BACKWALLS ON WHICH ASBESTOS SHEET PACKING IS TO BE PLACED SHALL BE STEEL TROWEL FINISHED.
2. BITUMINOUS MATERIAL, ITEM 61, SHALL BE APPLIED TO THE BACKS OF ALL ABUTMENTS AND WINGWALLS ABOVE TOP OF FOOTINGS, WHERE FILL IS IN CONTACT WITH THE WALLS.
3. EPOXY PROTECTIVE COATING FOR CONCRETE SHALL BE APPLIED TO THE FOLLOWING SURFACES:
   STUB ABUTMENTS - TOP AND SIDE SURFACES OF PEDESTALS, FACES OF BACKWALLS AND INSIDE FACES OF THE END CURTAIN WALLS. ALL SURFACES TO BE COVERED ABOVE THE FOOTING LEVEL.
   PIERS - ALL PEDESTAL SURFACES AND THE TOP SURFACES OF PIER BETWEEN PEDESTALS INCLUDING THE EDGE CHAMFER AT TOP EDGE OF PIER.
4. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FOR REINFORCING STEEL IN THE SUBSTRUCTURE SHALL BE AS FOLLOWS:

FOOTINGS (INCLUDING UNFORMED BOTTOM)	3"
WALLS ABOVE FOOTINGS	2"
BEAMS AND COLUMNS OF PIERS	2"

5. ABUTMENTS SHALL BE FOUNDED ON SELECTED GRANULAR FILL. FOR DESIGN PURPOSES, THE MAXIMUM SOIL PRESSURE IS 1.5 TONS PER SQUARE FT.

   PIERS SHALL BE FOUNDED ON CAST-IN-PLACE CONCRETE PILES. SEE NOTES AND DETAILS OF CAST-IN-PLACE CONCRETE PILES ON DWG. NO. M-9.

6. ITEM 83 TX TO BE USED ONLY WHERE DEPTH OF EXCAVATION EXCEEDS 5 FEET.

ELEVATION

℄ Galv. Steel Conduit for Street Light Item 310B (In Hwy Est)

Note: Item 312B to be included in Hwy Estimate

CONSTRUCTION PROCEDURE

1. POUR SLAB.
2. SET STONE CURBS (GRANITE) & POUR SAFETY WALKS TO PROPER LINE AND GRADE.
   SAFETY WALK NOT TO BE SCORED.
3. SET RAILING ANCHOR BOLTS BY MEANS OF TEMPLATE AND POUR PARAPET. ERECT RAILING.
4. ANCHOR BOLTS SHALL BE CUT OFF 1/8" ABOVE NUT AND PEENED.
   THE CUT TOPS SHALL BE PAINTED AS REQUIRED BY THE SPECIFICATIONS FOR M 18A, EXCEPT THAT THE FINAL TWO (2) COATS SHALL BE ALUMINUM PAINT COMPLYING WITH THE SPECIFICATIONS FOR M 18J.

SUPERSTRUCTURE NOTES

1. ALL BEARINGS ARE TO BE FIELD WELDED TO BEAMS.
2. UNLESS OTHERWISE NOTED, ALL STRUCTURAL STEEL SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATIO A36-62T.
3. HIGH STRENGTH BOLTS, NUTS AND WASHERS SHALL CONFORM TO THE REQUIREMENTS OF A. S. T. M. DESIGNATION A-325. ALL STRUCTURAL STEEL, REGARDLESS OF TYPE, WILL BE PAID FOR UNDER ITEM 29.
3. MINIMUM PREHEAT AND INTERPASS TEMPERATURES SHALL BE MAINTAINED FOR WELDING IN ACCORDANCE WITH THE FOI ING TABLES:

THICKNESS OF THICKEST PART AT POINT OF WELDING	MINIMUM PREHEAT AND INTERPASS TEMPERATURES
TO 1" INCL.	NONE*
OVER 1" TO 2" INCL.	50°F*
OVER 2"	150°F

*WHEN BASE METAL TEMPERATURES ARE BELOW 32°F PREHEAT BASE METAL TO AT LEAST 70°F AND MAINTAIN DURING WELDING.

4. TO INSURE UNIFORM GRADES FOR THE SURFACE OF ROADWAY UNDER DEAD LOAD, AFTER ALL SUPERSTRUCTURE STEEL I BEEN ERECTED AND BRACED IN ITS FINAL POSITION, ELEVATION SHALL BE TAKEN ON THE TOP OF THE STEEL AT THE CI LINE OF WEB AT EACH CENTER LINE OF BEARING. CENTER OF THE SPAN AND AT OTHER LOCATIONS WHERE THEORETIC/ BOTTOM OF THE SLAB ELEVATIONS ARE INDICATED ON THE PLANS.
   THE DEPTH OF HAUNCH REQUIRED TO POSITION THE SLAB FORMS WILL BE EQUAL TO THE DIFFERENCE IN ELEVATION BE THE BOTTOM OF SLAB ELEVATIONS AND THE TOP OF STEEL ELEVATIONS PLUS THE DEFLECTION DUE TO SUPERIMPOSED LOAD.
5. LOW HYDROGEN TYPE ELECTRODES, CONFORMING TO A. W. S. -A. S. T. M. SPECIFICATION FOR MILD STEEL ARC-WELDING, ELECTRODES, CLASSIFICATION E 7015, E 7016 & E 7018.
6. IF THE CONTRACTOR ELECTS TO USE CORRUGATED METAL FORMS FOR THE STRUCTURAL SLAB, THE DETAILS OF THESE I SHALL BE SUBMITTED TO THE DEPUTY CHIEF ENGINEER (BRIDGES) FOR APPROVAL, PRIOR TO THEIR USE. THE CONTRAC ATTENTION IS DIRECTED TO ADDITIONAL NOTES APPEARING IN THE PROPOSAL RELATIVE TO CORRUGATED METAL FORMS
7. UNLESS OTHERWISE SHOWN, THE MINIMUM CONCRETE COVER FOR REINFORCING STEEL IN THE SUPERSTRUCTURE SHALL I AS FOLLOWS:

BRIDGE SLAB - TOP OF SLAB	2"
BRIDGE SLAB - BOTTOM OF SLAB	1"
BRIDGE SLAB - EXTERIOR FACE	2-1/2"
EXTERIOR FACE OF PARAPET	2-3/4"
INTERIOR FACE OF PARAPET	2"

8. MAROON PRIMER, ITEM M18B, WILL NOT BE APPROVED FOR USE ON THIS CONTRACT.
9. FILLET WELDING ACROSS FLANGES WHICH CARRY TENSILE STRESSES SHALL ONLY BE PERFORMED WITH THE MINIMUM PREHEAT OF 200°F.
10. SAFETY WALKS SHALL NOT BE SCORED.

NOTES:

1. ALL AREAS SHOWN FOR CONCRETE REMOVAL ARE APPROXIMATE AND SHALL BE FIELD VERIFIED BY THE CONTRACTOR AND EIC.
2. CONCRETE REMOVAL TO LIMITS SHOWN INCLUDES SOUND CONCRETE AROUND THE PERIMETER OF THE DETERIORATED CONCRETE, A.O.B.E.
3. WHEN REMOVING EXISTING CONCRETE, SAWCUT 5 mm MIN. TO PRODUCE NEAT REMOVAL LINES. ANY COST TO BE INCLUDED IN THE BID PRICE FOR ITEM 582.05 M.
4. ELEVATIONS ARE GIVEN FOR REFERENCE ONLY.
5. REFER TO CONTRACT F.I.C. 64-7 FOR ORIGINAL CONSTRUCTION DETAILS.
6. FOR CONCRETE REPAIR DETAILS SEE DWG. BR-1.
7. RESTORE TO ORIGINAL DIMENSIONS.
8. PEDESTALS NUMBERED FROM WEST TO EAST.
9. STRUCTURAL LIFTING OPERATIONS FOR BEARING RESTORATION (ITEM 585.02 M), TYPE B (LIFTING FROM ABUTMENT SEAT) SEE DWG NO. TSL-1.
10. PERFORM EXPANSION BEARING RESTORATION TO BEARINGS NO. 1-14, (ITEM 15565.4302 M). SEE DWG NO. BR-6.
11. CRACKS IN BACKWALL AND PEDESTALS WILL BE REPAIRED AS ORDERED BY EIC BY INJECTION GROUTING METHOD UNDER ITEM 11555.8198 M.
12. SEE DWG. NO. BR-2 FOR DETAILS FOR PLACEMENT OF GALVANIZED ANODES IN PEDESTAL REPAIR AREAS.

PRECAST CONCRETE DETAILS

WHEN THE SLEEPER SLAB DETAIL IS NEEDED UNDER AN APPROACH SLAB WITH A CONCRETE BARRIER ATTACHED TO IT, THE SLEEPER SLAB SHALL BE FROM FACE OF BARRIER TO FACE OF BARRIER.

PRECAST SLEEPER SLAB DETAIL

NOTES:

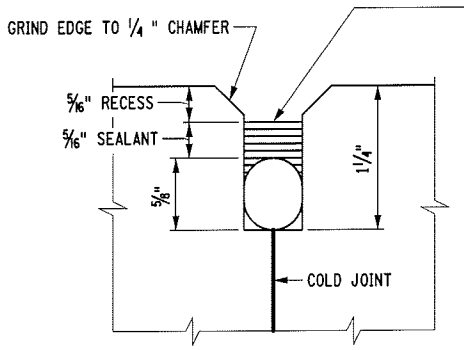
A. EXCAVATION FOR SLEEPER SLABS SHALL BE CAREFULLY MADE AFTER COMPACTED ABUTMENT EMBANKMENT IS IN PLACE. THE SLEEPER SLABS SHALL BE FOUNDED ON UNDISTURBED COMPACT MATERIAL OR RE-COMPACTED MATERIAL. NO LOOSE BACKFILL SHALL BE ALLOWED. THE CONTRACTOR SHALL TAKE ALL NECESSARY PRECAUTIONS TO PROTECT THE SLEEPER SLAB FROM TEMPORARY LOADINGS OR ANY CONDITION WHICH COULD CAUSE MOVEMENTS OR UNEVEN SETTLEMENT OF THE SLEEPER SLAB.

B. TOP OF SLEEPER SLABS SHALL BE STEEL TROWEL FINISHED AND COATED WITH A 0.04 in. NOMINAL THICKNESS OF PERFORMANCE GRADE ASPHALT AS INDICATED IN THE PROPOSAL, OR MATERIAL SPECIFICATION 702-3101. THE TOP OF SLEEPER SLABS SHALL FOLLOW THE CROSS SLOPE AND GRADE OF ROADWAY. COST TO BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB ITEM.

C. IF A MODULAR JOINT SYSTEM IS USED, CONCRETE FURNISHED AND PLACED IN THE RECESSES FOR INSTALLING THE JOINT SYSTEM SHALL COMPLY WITH THE SPECIFICATIONS FOR THE APPROACH SLAB ITEM, EXCEPT THAT MACHINE FINISHING WILL NOT BE REQUIRED. NO ADDITIONAL PAYMENT WILL BE MADE FOR FURNISHING AND PLACING THIS CONCRETE AS THIS QUANTITY LIES WITHIN THE LIMITS OF THE AREA TO BE PAID FOR UNDER THE APPROACH SLAB ITEM. IF AN ARMORLESS JOINT IS USED, PAYMENT FOR THE ELASTOMERIC CONCRETE HEADERS SHALL BE INCLUDED IN THE ITEM FOR THE JOINT SYSTEM. THE JOINT SYSTEM SHALL BE PAID FOR UNDER ITS APPROPRIATE ITEM.

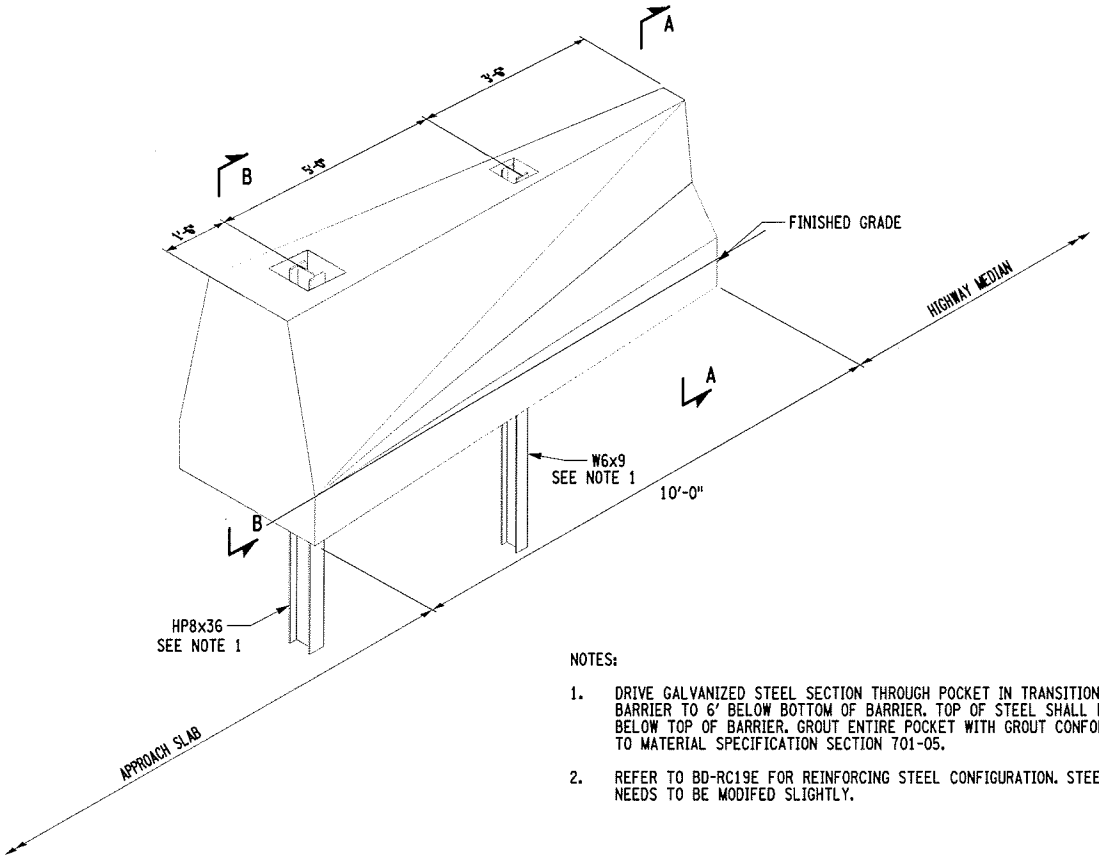
D. COMPRESSED SYNTHETIC SHEET GASKET, MATERIAL SPECIFICATION 728-06 (TWO 1/16" THICK SHEETS, TREATED BOTH SIDES) SHALL BE PLACED WITH PRECAST UNITS. SHIM AND GROUT AS CALLED FOR ON THE BACKWALL DETAILS. PRICE WILL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB ITEM.

E. PAYMENT FOR SLEEPER SLAB EXCAVATION SHALL BE INCLUDED IN THE APPROACH SLAB ITEM.



FILL THE RECESS WITH A STRUCTURAL JOINT MATERIAL, SILICONE SEALANT, FROM THE DEPARTMENT'S APPROVED LIST FOR ITEM 567.51--16. IF THE RECESS IS SAW CUT, WATER BLAST IMMEDIATELY FOLLOWING CUTTING TO REMOVE ANY RESIDUAL SLURRY BEFORE IT DRIES. CLEAN THE VERTICAL FACES OF THE RECESS BY ABRASIVE BLAST AND AIR BLOW THE RESIDUE FROM THE RECESS. PRIME THE VERTICAL FACES WITH THE MANUFACTURER'S RECOMMENDED PRIMER, AND ALLOW TO DRY. PLACE A 5/8" DIA. SOFT CLOSED CELL BACKER ROD IN THE BOTTOM OF RECESS. POUR THE SILICONE SEALANT TO A DEPTH OF APPROX. 5/16". PAYMENT TO BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB.

JOINT RECESS DETAIL



NOTES:

1. DRIVE GALVANIZED STEEL SECTION THROUGH POCKET IN TRANSITION BARRIER TO 6' BELOW BOTTOM OF BARRIER. TOP OF STEEL SHALL BE 3" BELOW TOP OF BARRIER. GROUT ENTIRE POCKET WITH GROUT CONFORMING TO MATERIAL SPECIFICATION SECTION 701-05.
2. REFER TO BD-RC19E FOR REINFORCING STEEL CONFIGURATION. STEEL NEEDS TO BE MODIFED SLIGHTLY.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 81 Bridge over Castle Street. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-03155-9 Interstate Route 81 Bridge over Castle Street

Type of Material	Estimated Amount
Caulking Compound	1 Linear Meter

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 81 Bridge over Castle Street (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-03155-9 Interstate Route 81 over Castle Street

Caulking Compound

Asbestos-containing caulking compound is located around a few of the guide rail base plates on both parapets on the bridge, and around the base of the light pole on the east parapet. It is estimated that the total amount of this caulking compound is approximately 1 linear meter. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this material are shown in the attached FIGURE 2. Analytical results of bulk samples collected are summarized in the attached TABLE.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

FEATURE CARRIED: **I-81 Southbound/Northbound**

FEATURE CROSSED: **East Castle St.**

TABLE OF CONTENTS

- LOAD RATING SUMMARY
- FIGURES (BRIDGE CROSS SECTION, FRAMING PLAN, AND GIRDER ELEVATION)
- AASHTOWARE BRIDGE RATING (FORMERLY VIRTIS) INPUT DATA
- AASHTOWARE BRIDGE RATING (FORMERLY VIRTIS) OUTPUT DATA
- RECORD DRAWINGS

Notes and Assumptions:

1. Load rating analysis of existing superstructure was performed by using AASHTOWare Bridge Rating software per project scope.
2. Based on In-depth bridge inspection report dated 3/31/2014, there was no significant section loss observed for the existing girders. However, due to the age of the steel a blanket 5% section loss was included in load rating.
3. Substructure is not included in the load rating analysis unless otherwise noted.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JUNE 6, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031559 (I-81/ E Castle St)

This memorandum summarizes the seismic screening conducted for BIN 1031559 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JULY 1, 2014

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1031559 (I-81 / E Castle St.)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, End of Bottom Flange Cover Plate	-15.41	63.92
Exterior Girders, End of Bottom Flange Cover Plate	-22.44	29.30

ITEM	REMARKS	PHOTO N0.
	The travelway has 4 lanes numbered from left to right for the purpose of this report.	
TP 349-22	Begin Abutment – Joints: The begin header is spalled along the begin edge for its full length with asphalt patches along it (Photo 1). The settlement is most pronounced at the left edge of lane 2 with a 1.5” elevation difference creating an impact from passing vehicles (Photo 2). The seal is in fair condition.	1,2
TP 349-23	End Abutment – Joints: There is up to 6” wide x 2” deep spalling along the end header creating an impact from passing vehicles (Photo 3). In lane 2 at the left the header is missing for a 2.5’ length with 3’ long cracked sections on either side (Photo 4). The seal is in fair condition.	3,4
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion sliding on bronze plates. Fascia Bearings 1 and 8 have rust and delamination. Pack rust has bowed the bronze plates inhibiting movement (Photo 5). The remainder of the bearings are in good condition.	5
TP 349-25	End Abutment – Bearings: The end bearings are expansion sliding on bronze plates. Pack rust has bowed the bronze plates on all of the bearings inhibiting movement (Photo 6). Fascia Bearings 1, 7, and 8 are the most severe. The rockers also have moderate pack rust.	6
TP 349-26	Begin Abutment – Seats and Pedestals: The bridge has stub abutments with no seats. Pedestal 1 has a 2’ long x 3/16” wide crack on its upper right corner (Photo 7). Pedestal 8 has a 2’ long x 1/8” wide crack at a similar location (Photo 8). The areas were not hollow sounding. The remaining pedestals are in good condition.	7,8
TP 349-27	End Abutment – Seats and Pedestals: The bridge has stub abutments with no seats. Pedestal 8 has cracking on its right face with a 0.5 square foot hollow sounding area (Photo 9). It has heavy rust staining at the begin right corner. The remaining pedestals are in good condition.	9

ITEM	REMARKS	PHOTO N0.
TP 350-21	Spans 1 through 3 - Deck Elements – Sidewalks and Fascias Sidewalks: The bridge has safety walks. The right safety walk has map cracking throughout (Photo 10). The left sidewalk is in good condition. Spalling on the outside edges is rated under Fascias. Fascias: The fascias in all three spans are in poor condition with numerous spalls, hollow areas, and cracks. Significant areas are noted below: Span 1 Left: 9' from begin - 3 sf x 2" deep spall at bottom with exposed rebar (Photo 11); 15' from begin – 0.4 sf x 2" deep spall (Photo 12); 18' from begin - 1.25 sf x 1.5" deep spall with exposed rebar. Span 2 Left: 2' from begin – 7" dia. x 1.5" deep spall at top (Photo 13); 0.75 span – 0.5 sf hollow area at top (Photo 14). Span 1 Right: Starting 2' from begin – 3' long and 6' long spalls both 10" high x 2" deep 1' apart with exposed rebar and hollowness surrounding (Photo 15); 20' from begin – 2.25 sf cracked and hollow area (Photo 16). End – 0.5 sf x 3" deep spall with exposed rebar and 1.5 sf hollow area to begin (Photo 17). Span 2 Right: Begin – 2 sf hollow area (Photo 17); 27' from end – 2 sf x 1" deep spall with exposed rebar at bottom and 0.5 sf x 1.5" deep spall at top corner (Photo 18); 18' from end – 1.25 sf x 4" deep spall at bottom corner with exposed rebar (Photo 19); 10' from end – 1.5 sf x 1" deep spall with exposed rebar (Photo 20). Span 3 Right: Begin – 0.5 sf x 3" deep triangular spall (Photo 21).	10 11-21
TP 350-22	Spans 1 through 3 - Deck Elements – Railings and Parapets: There are several rust through holes on the bottom faces of both bridge railings near the splices. Holes were found on the right bottom rails between Posts 2 and 3, between Posts 4 and 5, at Post 12, and between Posts 15 and 16. The largest hole was between Posts 2 and 3 and measures 2' long x 2.5" wide (Photo 22). The left railing had locations of holes on the top and bottom rails. Holes were found on the left railing between Posts 1 and 2, between Posts 3 and 4, between Posts 6 and 7, between Posts 12 and 13, between Posts 15 and 16, and between Posts 17 and 18. The most severe location was between Posts 1 and 2 where the top and bottom rails had holes (Photo 23). The top rail had an 18" long x 4" wide hole. The bottom rail had a 2.5' long x 4" wide hole on the bottom and smaller holes on the sides. The bottom splice was not connected. The heavy bridge rail post just to the begin of the bridge on the left has impact damage (Photo 24). The post is deflected 5" toward the begin and detached from the top rail. The top rail connection to Post 13 is loose (Photo 25). The remainder of the rails and posts are in good condition.	22-25

ITEM	REMARKS	PHOTO N0.
TP 350-27	Spans 1 through 3 - Superstructure – Structural Deck: The structural deck is a 9.75" thick concrete mono deck with SIP forms. The original deck was 7.5” thick, and there is no record in the inventory or BIN folder of a wearing surface addition. There are several hollow and patched areas as shown in the Deck Deterioration Plan (Photos 26 and 27). There are (2) 2.5" wide x 1" deep spalls at a seam in the wearing surface measuring 2' and 1' long located in Lane 2 in Span 3 (Photo 28). There is a 0.3 sf x 1/2” deep spall in Lane 1 in Span 1 at the end (Photo 29). Overall, 5.8% of the deck is damaged. The deck has SIP forms, and the underside is exposed only at the overhangs and at the haunches adjacent to the abutment backwalls. The forms are in good condition throughout all spans. The Span 2 right overhang has a 1.5 sf x 3” deep spall with honeycombing and exposed rebar located 3’ from the end (Photo 21). The remainder of the overhangs have areas of rust staining and map cracking throughout with some fascia spalls extending into the deck (Photo 30). The haunch at the begin abutment has a 15” long x 6” high x 3” deep spall at the left (Photo 31). The remainder of the haunches at both abutments have only hairline cracking.	21 26-31
TP 350-30	Spans 1 through 3 - Superstructure – Paint: The tops of the fascia outside bottom flanges have 20% to 50% paint failure in all spans (Photo 32). The fascia outside web faces typically have +/-5% paint failure. The right fascia girders are more severe in each span (Photo 33). Ends of girders and end diaphragms have up to 50% paint failure in locations of leaky joints (Photo 34).	32-34
TP 350-31	Span 1 Superstructure – Joints: The end header in the left lane has a 0.2 sf x ½” deep spall (Photo 29). There are 3 full width sections that sound hollow. The end header has 20” and 15” hollow lengths, and the begin header has a 2.5’ hollow length. The seal has lost its bond and is deflected and torn in lane 3 (Photo 35). The remainder of the seal and headers appear in good condition.	29,35
TP 350-31	Span 2 Superstructure – Joints: The seal is debonded and raised slightly on lanes 3 and 4 (Photo 36). The remainder of the seal appears in good condition. The headers are in good condition.	36
TP 350-33	Pier 1 – Bearings: Both rows of bearings on Pier 1 are fixed. Bearings 1, 6, 7, and 8 have areas of rust, delamination, and pack rust under the rockers (Photo 37). The remaining bearings are in good condition.	37

ITEM	REMARKS	PHOTO N0.
TP 350-34	Pier 1 – Pedestals: Spalls were noted on the begin faces of Pedestals 3 (1.4 sf x 1.25" deep) and 4 (1.9 sf x 1.5" deep) (Photo 38). The pedestals have other spalled, cracked, and hollow areas as shown in the Pier 1 Deterioration Sketch. None of the pedestal spalls undermine the bearings.	38
TP 350-37	Pier 1 – Cap Beam: There is a 1.8 sf x 1.5" deep spall on the end face of the cap beam under Pedestal 6 (Photo 39). The cap beams have other spalled, cracked, and hollow areas as shown in the Pier 1 Deterioration Sketch.	39
TP 350-38	Pier 1 Columns: Column 3 has a spall on its right face measuring 21.8 sf x 3" deep max (Photos 39 and 40). The begin, right, and end faces have hollow areas totaling +/-100 sf. The columns have other spalled, cracked, and hollow areas as shown in the Pier 1 Deterioration Sketch.	39,40
TP 350-33	Pier 2 – Bearings: The begin row of bearings on Pier 2 is expansion sliding on bronze plates, and the end row is fixed. Bearings 1, 6, 7, and 8 have areas of rust, delamination, and pack rust under the rockers (Photo 41). The expansion bearings have bowed bronze plates due to pack rust (Photo 42).	41,42
TP 350-34	Pier 2 – Pedestals: Pedestal 8 has a spall on its left top corner measuring full length x 3" deep (Photo 43). There is hollow sounding concrete on the top and begin faces. The pedestals have other spalled, cracked, and hollow areas as shown in the Pier 2 Deterioration Sketch. None of the pedestal spalls undermine the bearings.	43
TP 350-37	Pier 2 – Cap Beam: There is a 6 sf x 2" deep spall on the begin face at the bottom under Pedestal 2 with exposed rebar (Photo 44). There is also a 5 sf x 1.5" deep spall on the end face under Pedestal 8 (Photo 43). The cap beams have other spalled, cracked, and hollow areas as shown in the Pier 2 Deterioration Sketch.	44,43
TP 350-38	Pier 2 Columns: Column 2 has 53 sf of hollow sounding concrete which makes up over 20% of the area (Photo 45). The columns have other spalled, cracked, and hollow areas as shown in the Pier 2 Deterioration Sketch.	45

Note ID: 3A1310510810000

General Note for Bridge
Referenced Photos:
2013 - CSX Railroad Milepost QC 1.02.

Note ID: 3A1310510810002

Beg Abut -- Abutment: Bearings, Bolts, Pads -- Rated 4, Was 4
End Abut -- Abutment: Bearings, Bolts, Pads -- Rated 4, Was 4
Referenced Photos: "2", "3"
2013 - The bearings supporting Girders G1 & G8 of both abutments (fascia bearings) have rust and corrosion with the slider plates warped upwards from pack rust (Photos 2 & 3). This inhibits proper function of the bearings. Interior bearings are in better condition and would rate '5' alone.

Note ID: 3A1310510810004

Beg Abut -- Wingwalls: Walls -- Rated 5, Was 5
Referenced Photos: "5"
2013 - The front face of the begin left cheek wall has cracking, map cracking, rust staining and a 0.5 square foot area of spalling near the top. The begin right wingwall and cheek wall and remaining areas of the begin left wingwall and cheek wall are in better condition and would rate '6' alone.

Note ID: 3A1310510810005

Span 001 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Referenced Photos: "6", "7"
2013 - The right and left fascias in Span 1 have isolated areas of spalling with exposed corroded reinforcement with the right side being worse than the left side (Photos 6 & 7). Remaining areas of sidewalks and fascias in Span 1 would rate '5' alone.

Note ID: 3A1310510810008

Span 001 -- Deck Elements: Railings, Parapets -- Rated 4, Was 5
Span 003 -- Deck Elements: Railings, Parapets -- Rated 4, Was 5
Referenced Photos: "5", "19", "20"
2013 - Isolated areas of the lower rails at both sides of Spans 1 & 3 are severely corroded with significant section loss at rail splices (Photos 5, 19 & 20).
Remaining areas of the bridge rail system in Spans 1 & 3 are in better condition and would rate '5' alone.

Note ID: 3A1310510810009

Span 001 -- Superstructure: Paint -- Rated 4, Was 5
Span 002 -- Superstructure: Paint -- Rated 4, Was 5
Span 003 -- Superstructure: Paint -- Rated 4, Was 5

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,601,188

Note ID: 3A1310510810009 - continued

Referenced Photos: "8"
2013 - Both fascia girders in all 3 spans have peeling paint and surface rust, especially in lower areas of the girders. Similar rust and corrosion have occurred on fascia bearings and on superstructure steel beneath joints. The superstructure paint system in remaining areas of all 3 spans is in better condition and would rate '5' alone.

Note ID: 3A131051081000B

Span 001 -- Pier: Pedestals -- Rated 3, Was 4
Referenced Photos: "9"
2013 - The right side of the Pier 1 pedestal at Girder G8 has rust staining and severe spalling with exposed corroded reinforcement. Also, concrete on all 4 sides of this pedestal has horizontal cracking with punky sounding concrete. Remaining pedestals on Pier 1 are in good condition and would rate '5' alone.

Note ID: 3A131051081000E

Span 001 -- Pier: Pier Columns -- Rated 4, Was 4
Referenced Photos: "10"
2013 - Columns 2, 3 & 4 of Pier 1 have hollow sounding concrete with vertical cracks on approximately 30% of the begin, right and end faces. The right face of Column 3 of Pier 1 has severe spalling with exposed corroded reinforcement on approximately 50% of the face. The end face of Column 3 of Pier 1 has severe spalling with exposed corroded reinforcement on an area of approximately 5 square feet. Remaining areas of Pier 1 columns would rate '5' alone.

Note ID: 3A1310510810006

Span 002 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 5
Referenced Photos: "11", "12"
2013 - The right and left fascias in Span 2 have isolated areas of cracking, rust staining, efflorescence and spalling with exposed corroded reinforcement (Photos 11 & 12). Remaining areas of sidewalks and fascias in Span 2 would rate '5' alone.

Note ID: 3A131051081000A

Span 002 -- Pier: Bearings, Bolts, Pads -- Rated 5, Was 5
Referenced Photos: "13"
2013 - Pier bearings on Pier 2 are in good condition, but with minor rust.

Inspection Date: 6/20/2013 RC: 33 BIN: 1051081

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,601,188

Note ID: 3A131051081000C

Span 002 -- Pier: Pedestals -- Rated 3, Was 4
Referenced Photos: "14", "15", "16", "17"
2013 - The right side of the Pier 2 pedestal at Girder G2 has severe spalling with exposed corroded reinforcement (Photo 14). All 4 sides of the Pier 2 pedestals at Girders G3 & G4 have horizontal and transverse cracking and the concrete sounds hollow (Photo 15). The begin and right sides of the Pier 2 pedestal at Girder G8 have severe deterioration with cracking, efflorescence, rust staining and spalling with exposed corroded reinforcement and this pedestal is in poor condition throughout (Photos 16 & 17). Remaining pedestals on Pier 2 are in better condition and would rate '4' or '5' alone.

Note ID: 3A131051081000D

Span 002 -- Pier: Cap Beam -- Rated 4, Was 4
Referenced Photos: "17", "18"
2013 - The begin face of the Pier 2 cap beam near Column 1 has an approximate 6 square foot area of cracking and spalling with exposed corroded reinforcement (Photo 18). Similar spalling with exposed corroded reinforcement has also occurred on the begin face of the Pier 2 cap beam beneath the Girder G8 pedestal (Photo 17). The Pier 2 cap beam is also hollow sounding on approximately 10% of the area of the begin and end faces.

Note ID: 3A131051081000F

Span 002 -- Pier: Pier Columns -- Rated 4, Was 4
Referenced Photos: "18"
2013 - The right face of Column 2 of Pier 2 has hollow sounding concrete on approximately 30% of its surface. However, this condition is not sufficiently detrimental to warrant a rating lower than '5' for this item. Remaining areas of Pier 2 columns would rate '5' or '6' alone.

Note ID: 3A1310510810007

Span 003 -- Deck Elements: Sidewalks, Fascias -- Rated 5, Was 5
Referenced Photos: "11"
2013 - The right fascia at the begin of Span 3 has an isolated area of spalling with exposed corroded reinforcement. Remaining areas of sidewalks and fascias in Span 3 are generally solid and in better condition.

Note ID: 3A1310510810001

End Abut -- Abutment: Joint with Deck -- Rated 4, Was 4
Referenced Photos: "1"
2013 - The concrete header is spalled full width of the end abutment joint with deck resulting in poor rideability. The end abutment joint is otherwise intact full width.

Inspection Date: 6/20/2013 RC: 33 BIN: 1051081

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,601,188

Note ID: 3A1310510810003

End Abut -- Abutment: Seats and Pedestals -- Rated 4, Was 5
Referenced Photos: "4"
2013 - The right fascia pedestal on the end abutment supporting Girder G8 is cracked with efflorescence and rust staining. Remaining areas of bridge seat and pedestals on the end abutment would rate '6' alone.

Inspection Date: 6/20/2013 RC: 33 BIN: 1051081

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,601,188

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - Yes
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

2013 - Staggered diaphragms are exempt from 100% hands-on inspection because the webs are greater than 3/8" thick.

A 100% hands-on inspection was performed on welds at the ends of all cover plates.

General Notes To the Next Inspector:

2013 - The BIN Plate is mounted on the begin left wingwall.

Name of Feature Crossed is CSX Peat Street Lead.

CSX Railroad Milepost QC 1.02.

Staggered diaphragms are exempt from 100% hands-on inspection because the webs are greater than 3/8" thick.

Improvements Observed:

2013 - None

Inspection Date: 6/20/2013 RC: 33 BIN: 1051081

Quality Control Engineer Signature Date
Agency or Company represented by certifier

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JUNE 10, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051081 (I-690 Westbound / CSX Trans/Peat St)

This memorandum summarizes the seismic screening conducted for BIN 1051081 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JULY 1, 2014

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051081 (I-690 Westbound / CSX Trans/Peat St.)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, End of Bottom Flange Cover Plate	-7.53	66.69
Exterior Girders, End of Bottom Flange Cover Plate	-7.59	66.39

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 5.8% of the total deck surface area. The cores indicate the reinforcement steel is 4.25 inches to 4.5 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inch Bonded Concrete Overlay
  - The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. This alternative will result in an estimated extended useful life expectancy of 20 years.

  The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 5.75 inches

thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  This alternative will provide an estimated extended useful life expectancy of 35 years.

- Cost Estimate

  The estimated cost for this alternative is $870,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

  - Useful Life Expectancy

    This alternative will provide an estimated extended useful life expectancy of 40+ years.

  - Cost Estimate

    The estimated cost for this alternative is $1,083,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.

  - Useful Life Expectancy

    This alternative will provide an estimated extended useful life expectancy of 40+ years.

  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
	The travelway has 4 lanes numbered from left to right for the purpose of this report.	
TP 349-22	Begin Abutment – Joints: The seal is in good condition. The begin header has minor spalling on its begin corner for the full width with asphalt patching. There is s 5' length on the left lane that has up to 4" wide spalling with the begin approach pavement settled +/-3/4" (Photo 1). Transverse cracking was noted for a 4' length near the centerline of the travelway (Photo 2). No signs of significant leakage were observed underneath.	1,2
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion sliding on bronze plates. Fascia Bearings 1 and 6 have rust and delamination. Pack rust has bowed the bronze plates inhibiting movement (Photo 3). The remainder of the bearings are in good condition.	3
TP 349-25	End Abutment – Bearings: The end bearings are expansion sliding on bronze plates. Bearings 1, 5, and 6 have rust and delamination. Pack rust has bowed the bronze plates inhibiting movement (Photo 4). The remainder of the bearings are in good condition.	4
TP 349-27	End Abutment – Seats and Pedestals: The bridge has stub abutments with no seats. Pedestal 6 has a 1' wide x 6" high x 4" deep spall at the begin right (Photo 4). The remaining pedestals are in good condition.	4
TP 350-21	Spans 1 through 3 - Deck Elements – Sidewalks and Fascias Sidewalks: The bridge has safety walks. The left safety walk has ¾" deep max. spalling along the granite curb ranging from 1" to 6" wide (Photo 5). The spalling is worst in Span 1. There is 6" max. width spalling starting 10' from the end in Span 3 (Photo 6). The right safety walk has 2 lengths of ¾" deep max. spalling along the granite curb. There is a 4' length of 2" max. width spalling 30' from the end and a 10' length of 3" max. width spalling 40' from the end (Photo 7). Spalling on the outside edges is rated under Fascias. The remainder of both safety walks have isolated light map cracking.	5-7

ITEM	REMARKS	PHOTO N0.
TP 350-21	Spans 1 through 3 - Deck Elements – Sidewalks and Fascias (Continued) Fascias: The fascias in all three spans are in poor condition with numerous spalls, hollow areas, and cracks. Significant areas are noted below: Span 1 Left: 14' from begin – 2.5 sf x 2" deep spall at bottom with hollowness surrounding it (Photo 8); 17' from begin – 1.5 sf x 2" deep spall at top with exposed rebar and hollowness surrounding it (Photo 8); 21' from begin – 1.5 sf hollow area at top (Photo 9); 24' from begin – 2.5 sf hollow area at top with 10" x 4" x 2" deep adjacent spall (Photo 9). Span 3 Left: 15' from begin – 0.6 sf x 1.5" deep spall at top (Photo 10); 17' from begin – 1.5 sf x 1" deep spall with exposed rebar at bottom (Photo 10); 20' from begin – 0.6 sf x ½" deep spall at bottom with 1 sf of hollowness to begin (Photo 10); 15' from end – 2' long x 2" high x 2" deep spall (Photo 11). Span 1 Right: 12' from begin – 0.9 sf x 2" deep spall at top with exposed rebar hollowness surrounding it (Photo 12); 23' from begin – 0.5 sf 1" deep spall at top (Photo 13); 26' from begin – 2.5' long x 4" high x 2" deep spall with exposed rebar and hollowness surrounding it (Photo 14); 4' from end – 1 sf x 1" deep spall near bottom with 1.5 sf of hollowness to its begin (Photo 15). Span 2 Right: 10' from end – 6 sf x 2.5" deep spall with exposed rebar and 3 sf of hollowness to its end (Photo 16). Span 3 Right: 9' from begin – 1.5 sf x 1" deep spall with exposed rebar (Photo 17); 14' from begin – 6' long x 7" high x 1.5" deep spall with exposed rebar (Photo 18); 20' from begin – 5.5' long x 10" high hollow area with 1 sf x 1" deep spall (Photo 19); 27' from begin – 5' long x 6" high x 3" deep top corner spall with exposed rebar (Photo 20); 18' from end – 1.5 sf x 1" deep spall at bottom with exposed rebar (Photo 21); 9' from end – 3 sf hollow area (Photo 22).	8-22
TP 350-27	Spans 1 through 3 - Superstructure – Structural Deck: The structural deck is a 9.75" thick concrete mono deck with SIP forms. The original deck was 7.5" thick, and there is no record in the inventory or BIN folder of a wearing surface addition. There are several hollow, cracked, and patched areas as shown in the Deck Deterioration Plan (Photos 1 and 23). No spalling was found. The most severe location is a 6.2 sf hollow area with cracking at the end of Span 1 in the right lane (Photo 24). The concrete was broken into <0.5 sf sections but did not come loose with a hammer. Overall, 0.6% of the deck is damaged. The deck has SIP forms, and the underside is exposed only at the overhangs and at the haunches adjacent to the abutment backwalls. The forms are in good condition throughout all spans. The deck overhangs are very narrow and are rated under Fascias. There is a spall in the deck haunch at the begin right measuring 2' long x 5" high x 4" deep (Photo 25). No rebar is exposed. The remainder of the haunches at both abutments are in good condition.	1,23-25

ITEM	REMARKS	PHOTO N0.
TP 350-30	Spans 1 through 3 - Superstructure – Paint: The tops of the fascia outside bottom flanges have up to 100% paint failure in all spans (Photo 8). The fascia outside web faces typically have 10% to 20% paint failure mostly at the bottom. The left fascia girders are more severe in each span and also have 20% to 50% paint failure on their bottom flange bottom faces (Photo 26). The interior girders are better with isolated pinpoint rusting and edges of bottom flanges having flaking (Photo 27). Ends of girders at the bottom and end diaphragms have up to 50% paint failure in locations of leaky joints (Photo 28).	8,26-28
TP 350-31	Span 1 Superstructure – Joints: The seal is rising slightly and tearing at several locations throughout its length (Photo 24 and 29). The headers are in good condition. Underneath leakage is evident. Bay 5 has severe rusting with delamination on the steel plates (Photo 30). Bay 4 has only surface rust. The remaining bays appear in good condition from underneath.	24,29 30
TP 350-31	Span 2 Superstructure – Joints: The seal and headers appear to be in good condition. Underneath leakage is evident. Bay 2 has severe rusting with delamination on the steel plates (Photo 31). The remaining bays have only surface rust.	31
TP 350-33	Pier 1 – Bearings: Both rows of bearings on Pier 1 are fixed. Bearing 6 has delamination and pack rust under the rockers (Photo 28). Bearings 1 and 5 have rust with only minor delamination (Photo 32). The remaining bearings are in good condition.	28,32
TP 350-34	Pier 1 – Pedestals: Pedestal 4 has a 0.8 sf x 1.25” deep spall on its end face at the left with exposed rebar (Photo 33). Pedestal 6 has a 1.7 sf x 1.5” deep spall on its begin face at the left with exposed rebar (Photo 34). There is cracking on its end and right faces. Neither of the spalls undermine the bearing. The remaining pedestals are in good condition. See Pier 1 Deterioration Sketch.	33,34
TP 350-37	Pier 1 – Cap Beam: There are hollow and cracked areas and one spall detailed in the Pier 1 Deterioration Sketch. The spall is located on the begin right under Pedestal 6 and measures 0.9 sf x 1” deep with exposed rebar (Photo 34).	34
TP 350-38	Pier 1 Columns: The columns have cracking and hollow areas as detailed on the Pier 1 Deterioration Sketch. Column 4 is the most severe with +/-25% (55 sf) of its area sounding hollow (Photo 27). The right face is nearly 100% hollow with vertical cracking throughout.	27

FEATURE CARRIED: I-690 EB
FEATURE CROSSED: CSX TRANS/PEAT ST.

TEAM LEADER: A.THOMPSON
A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 350-33	Pier 2 – Bearings: The begin row of bearings on Pier 2 is expansion sliding on bronze plates, and the end row is fixed. The plates and rockers on Bearings 1, 2, and 6 have areas of rust, delamination, and pack rust under the rockers (Photo 35). The expansion bearings at these locations have bowed bronze plates due to pack rust which restricts movement.	35
TP 350-34	Pier 2 – Pedestals: The pedestals have areas of spalled and cracked concrete as detailed on the Pier 2 Deterioration Sketch. The most severe location is a 1.6 sf x 5” deep spall with exposed rebar on the top right corner of Pedestal 2 (Photo 36).	36
TP 350-37	Pier 2 – Cap Beam: The cap beams have areas of cracked and hollow concrete as detailed on the Pier 2 Deterioration Sketch. The most severe location is at the begin top corner to the left of Pedestal 3 where there is cracking and a hollow area measuring 3.1 sf on the begin face and 4.4 sf on the end face (Photo 36).	36
TP 350-38	Pier 2 Columns: The columns have areas of cracked, hollow, and spalled concrete as detailed in the Pier 2 Deterioration Sketch. The Column 1 left face has a 22 sf x 1.25” deep spall with exposed rebar, and the remainder is hollow (Photo 37). The Column 2 right face has 12.3 sf of 1” deep spalling with exposed rebar, and the remainder is hollow (Photo 38). No debonded rebar was noted.	37,38

NOTES:

1. PEDESTALS ARE NUMBERED AS SHOWN ON THE PLAN. SEE DWG. NO. ST-10 AND ST-11
2. EXISTING ELEVATIONS AND DIMENSIONS ARE FROM CONTRACT F.I.S.H. 68-4 AND ARE FOR REFERENCE ONLY.
3. CONTRACTOR SHALL REMOVE ALL DEBRIS FROM THE TOP OF THE PEDESTALS PRIOR TO SETTING NEW BEARINGS. COST TO BE INCLUDED IN THE BID PRICE FOR VARIOUS ITEMS IN CONTRACT.
4. FOR ANCHOR STUD DETAILS SEE DWG. NO. ST-14
5. FOR ANCHOR BOLT LAYOUT DETAILS SEE DWG. NO. ST-06.
6. FOR BAR LIST DETAILS SEE DWG. NO. ST-16 AND ST-17
7. FOR REINFORCEMENT DETAILS SEE DWG. NO. ST-06
8. THE CONTRACTOR SHALL FIELD VERIFY THE HEIGHT OF EXISTING BEARINGS AND COMPARE THEM WITH HEIGHT OF PROPOSED BEARINGS TO VERIFY THE NEW TOP OF PEDESTAL ELEVATIONS SHOWN ON THE CONTRACT PLANS. (SEE DWG. NO. ST-15 FOR PEDESTAL HEIGHT TABLE)
9. THE CONTRACTOR SHALL PROVIDE ¾" DEEP SAW CUT BETWEEN THE CONCRETE TO BE REMOVED AND THE CONCRETE TO REMAIN. THE COST OF THE SAWCUT SHALL BE PAID FOR UNDER ITEM 580.01.
10. APPLY PROTECTIVE SEALING, ITEM 18559.1696 TO ALL EXPOSED SUBSTRUCTURE SURFACES.

STRUCTURAL LIFTING NOTES:

11. LIFTING SHALL BE CONFINED TO ONE END OF A SPAN AT ANY ONE TIME.
12. VEHICULAR TRAFFIC CAN BE MAINTAINED DURING BEAM JACKING OPERATIONS AS LONG AS THE CONTRACTOR ONLY JACKS A SINGLE GIRDER AT A TIME TO A MAXIMUM OF ⅛".
13. ANY DAMAGED BRIDGE PAINT RESULTING FROM STRUCTURAL LIFTING (I.E.-WHERE CLAMPS ARE ATTACHED TO BOTTOM FLANGE) SHALL BE REPAIRED BY THE CONTRACTOR FOLLOWING THE REQUIREMENTS OF ITEM 574.01NNNN, COST TO BE INCLUDED IN THE BID PRICE FOR ITEM 585.01.
14. THE CONTRACTOR SHALL PROVIDE AND HAVE ON HAND AT THE PROJECT SITE, TEMPORARY SHORING/JACKING STANDBY SUPPORT SYSTEMS AVAILABLE FOR STRUCTURAL SUPPORT EMERGENCIES AS DIRECTED BY THE E.I.C.
15. THE CONTRACTOR SHALL HAVE THE GIRDERS/BEAMS STRUCTURALLY LIFTED PRIOR TO THE REMOVAL OF ANY CONCRETE ON PEDESTALS.
16. ONLY ONE STRUCTURAL LIFTING PAYMENT WILL BE MADE FOR EACH END OF GIRDER REGARDLESS OF THE NUMBER OF TIMES THE GIRDER IS LIFTED.

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,713,853

Note ID: 3A1310510820001

Beg Abut -- Abutment: Joint with Deck -- Rated 4, Was 5
Referenced Photos: "1", "2"
2013 - The begin abutment joint with deck allows minor to moderate leakage, especially in Bay 5 (Photo 1). The underside of the joint header is also spalled in this area (Photos 1 & 2). The top of the joint is intact with a slightly worn seal.

Note ID: 3A1310510820000

Beg Abut -- Abutment: Bearings, Bolts, Pads -- Rated 4, Was 4
End Abut -- Abutment: Bearings, Bolts, Pads -- Rated 4, Was 4
Referenced Photos: "3", "4"
2013 - The bearings supporting Girders G1 & G6 at both abutments (fascia bearings) have rust and corrosion with the slider plates warped upwards from pack rust (Photos 3 & 4). This inhibits proper function of the bearings. Interior bearings on both abutments are in better condition and would rate '5' alone.

Note ID: 3A1310510820002

Approaches: Guide Railing -- Rated 6, Was 2
Referenced Photos: "5"
2013 - The previously reported damaged approach guide railing at the end right has been repaired. The previously issued Safety Flag for this condition has been removed. Approach guide railing at all quadrants is in very good condition.

Note ID: 3A1310510820003

Span 001 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Span 002 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Span 003 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Referenced Photos: "6", "13"
2013 - The deck wearing surface in all spans has worn to a smooth surface with exposed aggregate, especially along the wheel paths (Photo 6). Tight transverse cracks were also observed in isolated areas.

There are isolated areas of shallow scaling on the deck wearing surface in all spans. These areas range from under 2 square feet up to approximately 4 square feet (Photo 13). Some of these areas may have been patched.

Note ID: 3A1310510820007

Span 001 -- Superstructure: Paint -- Rated 4, Was 5
Span 002 -- Superstructure: Paint -- Rated 4, Was 5
Span 003 -- Superstructure: Paint -- Rated 4, Was 5
Referenced Photos: "7", "8"
2013 - Both fascia girders in all 3 spans have peeling paint and surface rust, especially in lower areas of the girders (Photos 7 & 8). Similar rust and corrosion have occurred on fascia bearings and on superstructure steel beneath joints.

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,713,853

Note ID: 3A1310510820007 - continued

The superstructure paint system in remaining areas of all 3 spans is in better condition and would rate '5' or '6' alone.

Note ID: 3A1310510820008

Span 001 -- Superstructure: Joints -- Rated 4, Was 5
Span 002 -- Superstructure: Joints -- Rated 4, Was 5
Referenced Photos: "9", "14"
2013 - The superstructure joints full width of both piers have intact, but with compressed and squeezed joint seals (Photo 9). The undersides of the joints also have corroded armoring angle legs (Photo 14). In addition, the joints leak near both curbs resulting in rust on superstructure steel elements below.

Note ID: 3A1310510820009

Span 001 -- Pier: Bearings, Bolts, Pads -- Rated 4, Was 5
Span 002 -- Pier: Bearings, Bolts, Pads -- Rated 4, Was 5
Referenced Photos: "10", "18", "19"
2013 - The bearings supporting Girders G1 & G6 at both piers (fascia bearings) have rust and corrosion throughout with pack rust developing (Photos 10, 18 & 19). Interior bearings on both piers are in better condition and would rate '5' alone.

Note ID: 3A131051082000A

Span 001 -- Pier: Pedestals -- Rated 4, Was 4
Referenced Photos: "11"
2013 - The right face of Pedestal 6 on Pier 1 has cracking, efflorescence and rust staining. Remaining pedestals on Pier 1 are in better condition and would rate '5' alone.

Note ID: 3A131051082000D

Span 001 -- Pier: Pier Columns -- Rated 4, Was 4
Referenced Photos: "12"
2013 - The following deficiencies were observed on the Pier 1 columns:

Column 1 - Left face 75% of area hollow sounding
Column 2 - Begin face 10% of area hollow sounding
Column 2 - Right face 75% of area hollow sounding
Column 3 - Right and end faces 30% of each area hollow sounding
Column 4 - All four sides have 10% of each area hollow sounding
Column 4 - Vertical cracks with rust staining have developed on the right face

Remaining areas of the Pier 1 columns would rate '5' alone.

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,713,853

Note ID: 3A131051082000E - continued

Column 4 - Map cracking and vertical cracks with rust staining have developed on the right face

Remaining areas of the Pier 2 columns would rate '5' alone.

Note ID: 3A1310510820005

Span 003 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Referenced Photos: "25", "26"
2013 - Cracking, rust staining and spalling with exposed corroded reinforcement has occurred along approximately 20% of the right and left fascias in Span 3 (Photos 25 & 26).

Remaining areas of the right and left fascias in Span 3 would rate '5' alone with isolated areas of minor cracking.

Inspection Notes

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,713,853

Note ID: 3A131051082000D - continued

Note ID: 3A1310510820004

Span 002 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Referenced Photos: "15", "16"
2013 - Spalling with exposed corroded reinforcement has occurred along approximately 20% of the right fascia in Span 2 (Photo 16). One large spall has developed on the right at the begin of Span 2 and almost extends to the bridge railing base plate (Photo 15).

Remaining areas of the right and left fascias in Span 2 would rate '5' alone with isolated areas of minor cracking and rust staining.

Note ID: 3A1310510820006

Span 002 -- Deck Elements: Mono Deck Surface -- Rated 5, Was 5
Referenced Photos: "17"
2013 - Isolated cracks have developed in the mono deck surface scattered throughout Span 2. The mono deck surface in Span 2 is otherwise in good condition.

Note ID: 3A131051082000B

Span 002 -- Pier: Pedestals -- Rated 4, Was 4
Referenced Photos: "20"
2013 - The right faces of Pedestals 1, 2 & 3 on Pier 2 have cracking and rust staining and isolated areas are hollow sounding. Remaining pedestals on Pier 2 are in better condition and would rate '5' alone.

Note ID: 3A131051082000C

Span 002 -- Pier: Cap Beam -- Rated 5, Was 5
Referenced Photos: "21"
2013 - The begin face of the Pier 2 cap beam near the center of the pier has an approximate 6' long crack near the top. Remaining areas of the Pier 2 cap beam are in good condition.

Note ID: 3A131051082000E

Span 002 -- Pier: Pier Columns -- Rated 4, Was 4
Referenced Photos: "22", "23", "24"
2013 - The following deficiencies were observed on the Pier 2 columns:

Column 1 - Left face with cracking, efflorescence, rust staining and spalling with exposed corroded reinforcement on 75% of area (Photo 22)
Column 2 - Right face with cracking, efflorescence, rust staining and spalling with exposed corroded reinforcement on 60% of area (Photo 23)

Miscellaneous:

Time Required to Inspect Bridge: 3 Hours

Lane Closure Needs: None Required

Railroad Flagging is Required for 1.5 Hours

No Pedestrian Fence

No Snow Fence

The BIN Plate is in OK condition

Inspection Date: 6/20/2013 RC: 33 BIN: 1051082

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 690I 690I33012057 Crossed: CSX TRANS/PEAT ST CheckValue: 1,828,713,853

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - Yes
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

2013 - Staggered diaphragms are exempt from 100% hands-on inspection because the webs are greater than 3/8" thick.

A 100% hands-on inspection was performed on welds at the ends of all cover plates.

General Notes To the Next Inspector:

2013 - The BIN Plate is mounted on Bay 4 of the begin abutment backwall.

Name of Feature Crossed is CSX Peat Street Lead.

CSX Railroad Milepost QC 1.02.

Staggered diaphragms are exempt from 100% hands-on inspection because the webs are greater than 3/8" thick.

Improvements Observed:

2013 - The damaged approach guide railing at the end right has been repaired.

Inspection Date: 6/20/2013 RC: 33 BIN: 1051082

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JUNE 16, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051082 (I-690 Eastbound / CSX Trans/Peat St)

This memorandum summarizes the seismic screening conducted for BIN 1051082 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JULY 1, 2014

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051082 (I-690 Eastbound / CSX Trans/Peat St.)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components have been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, End of Bottom Flange Cover Plate	10.84	157.08
Exterior Girders, End of Bottom Flange Cover Plate	-11.99	44.77

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.6% of the total deck surface area. The cores indicate the reinforcement steel is 4.25 inches to 4.5 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inch Bonded Concrete Overlay
  - The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. This alternative will result in an estimated extended useful life expectancy of 20 years.

  The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 5.75 inches

thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  This alternative will provide an estimated extended useful life expectancy of 35 years.

- Cost Estimate

  The estimated cost for this alternative is $745,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

  - Useful Life Expectancy

    This alternative will provide an estimated extended useful life expectancy of 40+ years.

  - Cost Estimate

    The estimated cost for this alternative is $977,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.

  - Useful Life Expectancy

    This alternative will provide an estimated extended useful life expectancy of 40+ years.

  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are expansion. The begin joint is steel armored compression seal type in poor condition. The steel armor plate is rusted throughout with several bent locations from impact damage (Photo 1). The concrete headers are in poor condition. Both headers are cracked at one foot to 3 foot intervals (Photo 1). The begin side header is cracked and segmented 3 inches wide x 2 feet long in the 2nd lane from the left (Photo 2); and severely spalled and segmented with exposed reinforcement 5 feet wide x 5 inches deep in the 3rd lane from the left (Photo 3). The armor plate anchor studs are exposed and debonded; and the armor plate is cracked through at the right side of the spall (Photos 4 & 5). The compression seal is generally in satisfactory condition except at the damaged header location where the armor plate is loose and the seal has sagged (Photo 5). There is severe leakage down the backwall in bay 3 (Photo 6).	1,2,3,4 5,6
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion. The fascia bearings are rusted with pack rust between the sole plates and the sliders; and between the bronze sliding plate and the masonry plate (Photos 7 & 8). The front edges of the bronze sliding plates are warped. All of the bearings are in a normally contracted position at 30 ºF. The bearing slider at G1 is misaligned +/- 0.5 inch in relationship to the masonry plate with the front edge of the slider overhanging the bronze sliding plate by ¼ inch at the left side, and at the right side, the slider is inside of the front edge of the bronze sliding plate by ¼ inch (Photo 9). There are no cracks or other distortions evident. The interior bearings are in better condition.	7,8,9
TP 349-26	Begin Abutment - Seat and Pedestals: The begin seat is cracked along the left front edge in pedestal bay 1 (Photo 10). The remainder of the seat is in good condition with only minor scattered shrinkage cracking and no hollow areas detected. Pedestal P1 is tight mapcracked over 50% of the right side but no hollow areas detected (Photo 10). Pedestal P8 has a full height crack on the front face and tight mapcracking on the left side (Photos 11 & 12). There is a 0.5 square foot hollow sounding area on the top of pedestal P8 at the front right corner of the masonry plate and several tight cracks on the top. See Begin Abutment Deterioration Sketch. The interior pedestals are in good condition with no significant cracks or hollow areas detected.	10,11,12
TP 349-28	Begin Abutment – Backwall: The entire backwall has tight hairline mapcracking (Photo 13). At the top left side, there is cracking along the edge of a patch with seepage and heavy efflorescence down the backwall (Photo 14). There are several hairline vertical cracks as shown on the Begin Abutment Deterioration Sketch. At the left fascia bay (Photo 14) and in girder bay 3 (Photo 6), there is leakage and heavy seeping of water down the backwall.	6,13,14

ITEM	REMARKS	PHOTO NO.
TP 349-30	Begin Abutment – Stem: The stem has a patchwork of various vintage repairs and has a surface sealant applied. There are scattered vertical hairline cracks as shown on the Begin Abutment Deterioration Sketch. A 2 square foot hollow sounding area is noted beneath the right side of pedestal P2 (Photo 15). No other significant cracks or hollow areas were detected.	15
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end bearings are fixed. The steel armor angle was removed and replaced with a concrete pavement transition header. At the top, there is no joint visible. The concrete transition header is severely cracked, segmented and spalled up to 3 inches deep with exposed reinforcement in the two left lanes and left shoulder (Photo 16 & 17).	16,17
TP 349-25	End Abutment – Bearings: The end bearings are fixed. All of the bearings have pack rust between the rocker and the masonry plate that restricts movement. The fascia bearings G1 and G8 are the worst (Photos 18 & 19).	18,19
TP 349-27	End Abutment - Seats and Pedestals: Seat - The front edge of the seat is cracked 2 feet long with staining in pedestal bay 1 (Photo 20). The remainder is in good condition with no significant cracks or hollow areas detected.	20
	Pedestals – The top and front face of pedestal P1 has a hairline crack at the left side of the masonry plate. Also, pedestal P1 has a 1/8 inch wide crack on the top from the right anchor bolt wrapping down the right side (Photo 21). There is staining and efflorescence bleeding from the crack. Pedestal P8 has a similar crack on the right side but less severe (Photo 22). The remaining pedestals are in good condition with no significant cracks or hollow areas detected.	21,22
TP 349-29	End Abutment – Backwall: There is seepage down the left side backwall with efflorescence and staining (Photo 23) and there is tight hairline mapcracking throughout the left side (Photo 24). There are scattered vertical hairline cracks with efflorescence (Photos 24 & 25) as illustrated on the End Abutment Deterioration Sketch. At the right fascia bay, there is hairline mapcracking with efflorescence (Photo 26).	23,24,25 26
TP 349-31	End Abutment – Stem: There is seepage down the left side stem wall with efflorescence and staining and a 10 square foot hollow sounding area with a 2 feet high x 3 inches wide x 1 inch deep spall are noted at the left side beneath pedestal bay 1 (Photo 27). There are scattered vertical hairline cracks as shown on the End Abutment Deterioration Sketch (Photo 28).	27,28

ITEM	REMARKS	PHOTO NO.
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: There is a build-up of gravel along the begin left approach which traps runoff along the curb and there is shallow ponding at the begin left joint (Photo 29). At the end left approach, the concrete pavement transition header is raised 0.5 inch which traps runoff and there is shallow ponding on the deck at the end left curbline (Photos 17 & 30). The poor drainage conditions at the left side begin and end pavement transitions allow runoff to seep into the pavement and abutment backfill. There is leakage and seepage evident at the begin and end left backwalls (Photos 14 & 23).	14,17,23 29,30
TP 349-55	Approach - Settlement: There is no significant settlement at the begin approach, however, the deteriorated concrete joint header causes a bump with poor ride quality (Photo 3). At the end left approach, the concrete pavement transition header is raised 0.5 inch and the poor condition of the transition header causes a poor ride quality (Photo 16).	3,16
TP 349-57	Approach - Pavement: At both approaches, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with up to 4 inches wide x up to 2 inches deep potholes along the concrete headers. (Photos 2 & 16).	2,16
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth (Photo 31). There is severe wear of the deck surface with most of the transverse traction grooving polished smooth.	31
TP 350-20	Deck - Curbs: The granite curbs are in good condition. There are scattered locations where the curb joints have missing mortar (Photo 32). The average curb reveal is +/- 8 inches.	32
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – Left - The left safety walk has light mapcracking with light efflorescence over approximately 80% of the surface (Photo 33). There are several patched areas that wrap vertically around the upper portion of the fascia. Several of the patches are deteriorating with cracks and spalls along the edges of the patches. The worst is between railing posts # 8 and #9 where the patch is spalled and the surface scaled up to 1.5 inches deep with exposed reinforcement (Photo 34). The area has a crumbly concrete surface over an 8 square foot area. There are several longitudinal cracks 2 to 3 feet long along the outside of railing posts # 6 and #8. There is a 1 square foot area of hollow sounding concrete at railing post #8.	33,34
	Right - The right safety walk has map cracking throughout. There are longitudinal cracks over 50% of the length and one to two square foot spalled areas up to 2 inches deep with scattered hollow areas in 50% of the railing bays (Photo 35). The concrete surrounding the spalls is damp and crumbly.	35

ITEM	REMARKS	PHOTO NO.
	Fascias – Left - The upper (safety walk) portion of the left fascia is tight mapcracked with light efflorescence over approximately 80 % of the surface (Photo 36). The worst areas are near the bridge railing posts. The area between railing posts #8 and #9 has a spall that is wrapped around the top edge from the safety walk above (Photo 34). Near railing post #10, there is a full height x 6 inches wide x 1 inch deep spall (Photo 37). The lower portion of the left fascia has tight mapcracking over most of the surface. Near the begin 1/3rd span, there is a tight horizontal crack with efflorescence leakage just below the upper safety walk (Photo 36). Below railing post #10, there is a 2 feet long x 6 inches high x 2 inches deep spall (Photo 37).	34,36,37
	Right - The upper (safety walk) portion of the right fascia is mapcracked with light efflorescence over approximately 10% of the surface (Photo 38). The worst area is in the begin ¼ of the span. The lower portion of the right fascia has tight mapcracking over 50% of the surface. There are several scattered areas of horizontal cracks with light efflorescence (Photo 38).	38
TP 350-22	Deck - Railings: The railings are generally in good condition. The galvanized surface is dull with only minor rust freckling of the galvanized surface. On the right side, the railing is rusted in the vicinity of the railing splices but no rust through holes were noted (Photo 39). At the end left, the bottom rail is bent 3 inches upward and 3.5 inches outward from impact damage (Photo 40). The rail is still firmly attached to the posts.	39,40
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the original structural deck was 8 inches thick concrete mono deck. The plans indicate the original curb height was 10 inches. The plans do not indicate stay-in-place (SIP) forms; however, there are existing SIP forms in-place. Records indicate the deck was repaired, the surface was scarified and it received a 1.75 inch concrete overlay in 1981. The existing curb height is 8 inches. Given the existing SIP's and the 8 inch curb reveal, it is likely that the deck overlay thickness was at least 2 inches yielding a 10 inches thick deck.	
	Top of Deck - There is random cracking throughout with scattered hollow areas as illustrated in the Top of Deck Deterioration Sketch. The total hollow sounding and spalled area of the deck is 1.4% of the surface. Additionally, specific deck conditions are noted	
	• Near the begin in all lanes – a meandering transverse 1/8 inch to ¼ inch wide crack with adjacent hollow sounding areas (Photos 41 & 42).	41,42
	• Lane 1 near end – a pattern of transverse cracking at +/- 2 feet interval (Photo 43).	43
	• Lane 1 at the end – severely cracked with transverse and diagonal cracking (Photo 44).	44
	• Lane 2 @ left side construction joint – a 1/8 inch wide crack 80% of the span length (Photo 45).	45
	• Lane 3 @ middle construction joint - a hairline to 1/8 inch wide crack 50% of the span length and a 3.5 feet long x up to 3 inches wide x 2.5 inches deep spall along the crack near 2/3 span (Photo 46).	46

ITEM	REMARKS	PHOTO NO.
	Underdeck – The underside of the deck is SIP forms in good condition (Photo 47). There is minor surface rusting of the SIP forms at the begin in girder bays 3 and 4 where there is leakage at the begin joint header (Photo 48).	47,48
TP 350-28	Primary Members: The primary members are in good condition with only surface rusting where the paint has blistered or peeled (Photo 47). No significant section loss was noted.	47
TP 350-29	Secondary Members: The secondary members (diaphragms) are in good condition with only surface rusting where the paint has blistered or peeled. No significant section loss was noted.	
TP 350-30	Paint: The paint system is failed on less than 5% of the surfaces of the girders and diaphragms (Photo 47). There is cracking and peeling of the paint on the bottom flanges. The worst is the outside bottom flange of the left fascia girder (Photo 49). The outside web of the right fascia girder has scattered blistering and peeling paint over 5% of the surface (Photo 50). There is surface rusting where the paint has peeled or blistered.	47,49,50
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None visible.	
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · Diaphragm gusset plate welded connections to bottom flanges of all girders.

STIFFENERS OR CONNECTION PLATES USED IN PAIRS

STIFFENER OR CONNECTION PLATES USED SINGLY

BEARING STIFFENERS

NOTES
1. All connection plates for diaphragms are 7/16" ℄'s. These plates shall be attached to webs with continuous welds so as to develop their full strength as per specifications of the American Welding Society. Where holes are indicated on the drawings these connections shall be made with 3/4" ℄ rivets or high strength bolts. Holes may be omitted & welding substituted if the Contractor so elects. Amount of welding used shall be equivalent in strength to the rivets or bolts.
2. All bearing stiffeners are 8 1/2" x 3/4" ℄'s.
3. All intermediate stiffeners are 4 1/2" x 5/16" ℄'s.

Note ID: 351210511200001

Beg Abut -- Wingwalls: Walls -- Rated 5, Was 4
End Abut -- Wingwalls: Walls -- Rated 5, Was 4
Referenced Photos: "1", "2"
2012 - The begin and end left U-walls have been patched. The begin and end right U-walls have hairline mapcracking, but still sound and in a 5 condition.

Note ID: 351210511200002

Approaches: Settlement -- Rated 4, Was 6
Approaches: Pavement -- Rated 4, Was 6
Referenced Photos: "3"
2012 - The end pavement has a concrete "pavement joint header" that is spalling on each side. It is breaking up and settled in the 2nd lane from the left approx. 6" round exposing horizontal rebar. The asphalt is spalling on the edge approx. 3" wide.

Note ID: 351210511200003

Approaches: Guide Railing -- Rated 5, Was 4
Referenced Photos: "4"
2012 - The begin right posts have been bent back and re-attached.

Note ID: 351210511200004

Span 001 -- Deck Elements: Wearing Surface -- Rated 4, Was 5
Span 001 -- Deck Elements: Mono Deck Surface -- Rated 4, Was 5
Referenced Photos: "5", "6"
2012 - The wearing surface in general is worn smooth with polished aggregates mainly in the wheel paths. The begin has an 1/8" wide meandering crack in the center to right lanes approx. 4' from the begin joint. The 3rd lane from the left lane has a spall along the construction joint pour line approx. 4' long by 2" wide.

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 481I 481I33012058 Crossed: PROPOSED I690 CheckValue: 1,791,583,067

Overall Condition:

GENERAL RECOMMENDATION: 6

Computed Condition Rating: 5.297

Problems Requiring Action:

NO Further Investigation Needed

NO Flags Issued

POSTINGS:

Inspector Confirmed existing Posting data as correct.
Posted Vertical Clearance ON the bridge is: No Posting
Posted Vertical Clearance UNDER the bridge is: No Posting
No Load Restriction is posted on this bridge

Overloads Observed:

NO Overload Vehicles were observed on this bridge

FEDERAL RATINGS:

NBI Deck Condition: 6
NBI Superstruct Condition: 7
NBI Substruct Condition: 6
NBI Channel Condition: N
NBI Culvert Condition: N

Diving Inspection Needs:

Diving Inspection Required? No Date of Last Diving Inspection: No Date

Inventory Problems:

Inventory Problems Exist? No

Miscellaneous:

Time Required to Inspect Bridge: 2 Hours

Lane Closure Needs: By State for 1 Hours

No Railroad Flagging Required

No Pedestrian Fence

No Snow Fence

The BIN Plate is in OK condition

Inspection Date: 5/21/2012 RC: 33 BIN: 1051120

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 481I 481I33012058 Crossed: PROPOSED I690 CheckValue: 1,791,583,067

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - Yes
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

E' welds are not exempt from 100% hands-on inspection due to primary members being curved and analysis cannot be done. Therefore not exemt from henceforth.

General Notes To the Next Inspector:

Bin plate is on the begin stem approx. under ped 3.

Improvements Observed:

Inspection Date: 5/21/2012 RC: 33 BIN: 1051120

Review Progress and Personnel Present at Inspection

Carried: 481I 481I33012058 Crossed: PROPOSED I690 CheckValue: 1,791,583,067

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 27, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051120 (I-481 NB / I-690)

This memorandum summarizes the seismic screening conducted for BIN 1051120 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JANUARY 26, 2015

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1051120 (I-481 Northbound / I-690 Eastbound Connection)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has been **exhausted**.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, Gusset plate welds	-21.51	16.77
Exterior Girders, Gusset plate welds	-28.76	-18.92

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 1.4% of the total deck surface area. The cores indicate the reinforcement steel is 5 inches to 5.5 inches below the surface of the deck. Additionally, the cores indicate the reinforcement steel is epoxy coated. The core lab tests indicate that chloride ion concentrations at the deck surface are nearly ten times higher than the corrosion threshold for steel; however, they decrease rapidly to only two times the threshold at a depth of 3 inches. The chloride ion penetration profile indicates it is likely that chloride concentrations would be below the threshold at a depth of 4 inches below the surface for most of the deck area.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The top 2.25 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2.25 inches of the existing deck will remove the portion of the deck with the highest chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. However, the rate of migration can be significantly reduced with the removal of the top of the deck with the highest chloride ion concentration of chloride ions. Additionally, concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative - 4 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative is similar to the 2 inches Bonded Concrete Overlay except the top 4.25 inches of the entire deck will be removed. This additional depth of concrete removal would bring the chloride concentrations of the remaining deck to below the corrosion threshold for steel. Areas of deteriorated concrete will be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 4 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    A concrete overlay will not completely prevent chlorides from penetrating through the overlay itself and into the structural deck, however, concrete admixtures will be included in the bonded concrete overlay to impede the penetration of chloride into the deck. This alternative will result in an extended useful life expectancy estimated at 30 years.
  - Cost Estimate

    The estimated cost for this alternative is $517,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a 6 inches thick concrete deck yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $653,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $800,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The joints are expansion. The joint headers and compression seal are in good condition in the left travelway. The headers in the right travelway have hairline cracking at 2'-3' spacing (Photo 1). A foam seal has been added for most of the right travelway where the compression seal is missing (Photo 1). The foam seal is losing its bond for +/-1.5' near the right. Active leakage was noted under this location and daylight could be seen through the opening (Photos 2 and 3).	1-3
TP 349-23	End Abutment - Joint with Deck: The joints are expansion. The joint headers are in good condition in the left travelway, but the compression seal has lost its bond in the left half (Photo 4). The headers in the right travelway have hairline cracking at 2'-3' spacing (Photo 5). A foam seal has been added for most of the right travelway where the compression seal is missing (Photo 5). The foam seal is losing its bond for +/-2' near the center of the lane. Active leakage was noted below (Photos 6).	4-6
TP 349-25	End Abutment – Bearings: The bearings are expansion sliding plates. The left anchor bolt on Bearing 3 is bent toward the begin (Photo 7). The bearing appears to be functioning properly. The remaining bearings are in good condition.	7
TP 349-27	End Abutment – Seats and Pedestals: No hollow sounding areas were found on the seats or pedestals. There is a 5" dia. x ½" deep spall on the seat at the right (Photo 8). The seat in Bay 3 has a 1/8" wide x +/-3' long crack (Photo 6). The vertical faces of Pedestals 4 and 5 have map cracking (Photo 9). The remainder of the seats and pedestals are in good condition with isolated hairline cracking.	6,8,9
TP 349-29	End Abutment – Backwall: There is an 8" x 3" x 1.5" deep spall with no rebar at the top left (Photo 11), and a 3" dia. x ½" deep spall near the bottom behind Girder 1 (Photo 10). At the top right there is a 6" dia. x 1.5" deep spall with no rebar (Photo 12). The backwall at both ends has hairline cracking with heavy rust and efflorescence staining but no hollow areas. The interior bays have rust staining (Photo 13).	10-13
TP 349-30	Begin Abutment – Stem: The stem has several hollow areas at throughout its length at ground level (Photos 14 and 15). The sum of the hollow areas is 13.0 sf or 6.3% of the stem face. There is an 8' long x 1/16" wide crack at the bottom in Bay 1 with hollowness along the crack (Photo 16). The remainder of the stem face is in good condition with isolated hairline cracking. See Begin Abutment Deterioration Sketch.	14-16

FEATURE CARRIED: RAMP FROM/TO I90/I481
FEATURE CROSSED: I481

TEAM LEADER: A.THOMPSON
A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 349-31	End Abutment – Stem: There is one 4 sf hollow area under Bay 2 (Photo 17). The remaining stem has scattered cracks measuring less than 1/16" in width, some with efflorescence and rust staining (Photo 13 and 18). Many of the cracks are at the edges of previously patched areas.	13,17 18
TP 350-20	Spans 1 and 2 - Deck Elements – Curbs: The 2012 Biennial Inspection Report has the Curbs item rated 4 due to standing water and debris on the bridge and approaches. This report will not rate approach elements or drainage. The curbs are in good condition.	
TP 350-21	Spans 1 and 2 - Deck Elements - Sidewalks and Fascias: Sidewalks: The safety walks are in good condition. Fascias: The left fascia has map cracking throughout both spans (Photo 19) and a 1/16" wide x 20" long crack at the bottom under the last snow fence post in Span 2 (Photo 20). The right fascia has map cracking throughout both spans. There is a 1' x 5" x 2" deep spall in Span 2 at the top of the right fascia under the 4th rail post (Photo 21). The spall does not undermine the anchor plate. There is a 1/16" wide x 1.5' long crack in Span 2 under the 5th last rail post (Photo 22). The next 3 rail posts have cracks below them in the fascia that are similar but less severe.	19-22
TP 350-22	Spans 1 and 2 - Deck Elements – Railings/Parapets Snow fencing is present over the I481 travel lanes and median on both sides of the bridge. The snow fence consists of 16 steel pipe posts located at rail posts, steel pipe rails, and chain link fencing. On the left the bottom pipe rails at Posts 5, 6, and 8 are rusted through and detached on one or both sides (Photo 23 typ.). The bottom rails at several other posts are rusted but intact. On the right the bottom pipe rails at Posts 3, 4, 5, 7, 8, and 10-15 are rusted through and detached on one or both sides (Photo 21 typ.). The bottom rails at several other posts are rusted but intact. The remainder of the snow fencing is in good condition. The bridge railing and posts on both sides are in good condition. There is a single box beam railing with steel posts along the centerline of bridge that divides the two travelways. The first post is twisted and detached from the rail (Photo 24). The 15th post from the end in Span 2 is detached from the rail and deflected toward the begin (Photo 25).	21 23-25

TEAM LEADER: A.THOMPSON
A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 350-27	Spans 1 and 2 - Superstructure – Structural Deck: The structural deck is an 8.5" thick concrete mono deck. There are several hollow areas, hairline cracks, and a few patches in the top surface of the deck as illustrated in the Span 1 and Span 2 Deck Deterioration Plans (Photos 4, and 26 – 30). Overall, 0.9% of the deck in Span 1 and 1.2% of the deck area in Span 2 is hollow or patched. The underside of the deck does not have SIP forms and is visible for inspection. The deck has spalling with exposed rebar at the begin left corner of Span 1 and the end right corner of Span 2. The spall at the begin left is 3'-8" long x 9" wide x 3" deep (Photo 31). The spall at the end right is 2.5' long x 7" wide x 6" deep (Photo 32). The remainder of the underside has scattered hairline cracking on the fascias (Photo 33) and isolated hairline cracking in the interior bays (Photo 34). No hollow areas were found on the underside on either span.	4,26-34
TP 350-28	Spans 1 and 2 - Superstructure – Primary Members: The steel girders in both spans are in good condition with no significant section loss (Photo 35 and 36).	35,36
TP 350-30	Spans 1 and 2 - Superstructure – Paint: The girders are made of weathering steel and form a protective coating. The coating is coming off in the form of small to medium sized flakes on the bottom faces of the fascia bottom flanges (Photo 35) and the top faces of the interior bottom flanges (Photo 36). The condition is worse near both abutments (Photos 15 and 16). The remaining steel surfaces have only minor peppering and flaking (Photo 34).	15,16 34-36

FRAMING NOTES

Cross frames may be fabricated to fit the girders in their erected position and detailed shape, but deflected vertically under the dead load of the steel work only.

The Contractor may place diaphragms on either side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment, provided the work is done in accordance with other structural details.

Snipe the outstanding leg of all angles and plates 1" minimum.

GIRDER DETAIL

Scale: Horiz. 1/8" = 1'-0"
Vert. 1/4" = 1'-0"

Welding Notes:

* F.P.G.W. = Full Penetration Groove Weld
M.B. = Mill to bear

Welding Note "A"

No welding of stiffeners in connection plates to tension flanges. Plates should be tight fit.

Welding Note "B"

All connection plates used in pairs shall be welded to the web and be placed paint tight against both flanges. This may be accomplished by cutting the connection plates 1/8" short and then placing the connection plate tightly against the tension flange and welding the opposite end to the compression flange. Fitted connection plates shall not be driven in place with sufficient force to distort the flange web or connection plates.

All steel to be A588 unless otherwise noted

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481-3301-2143. 1481 INTERCHANGE NORTH OF THE CITY.

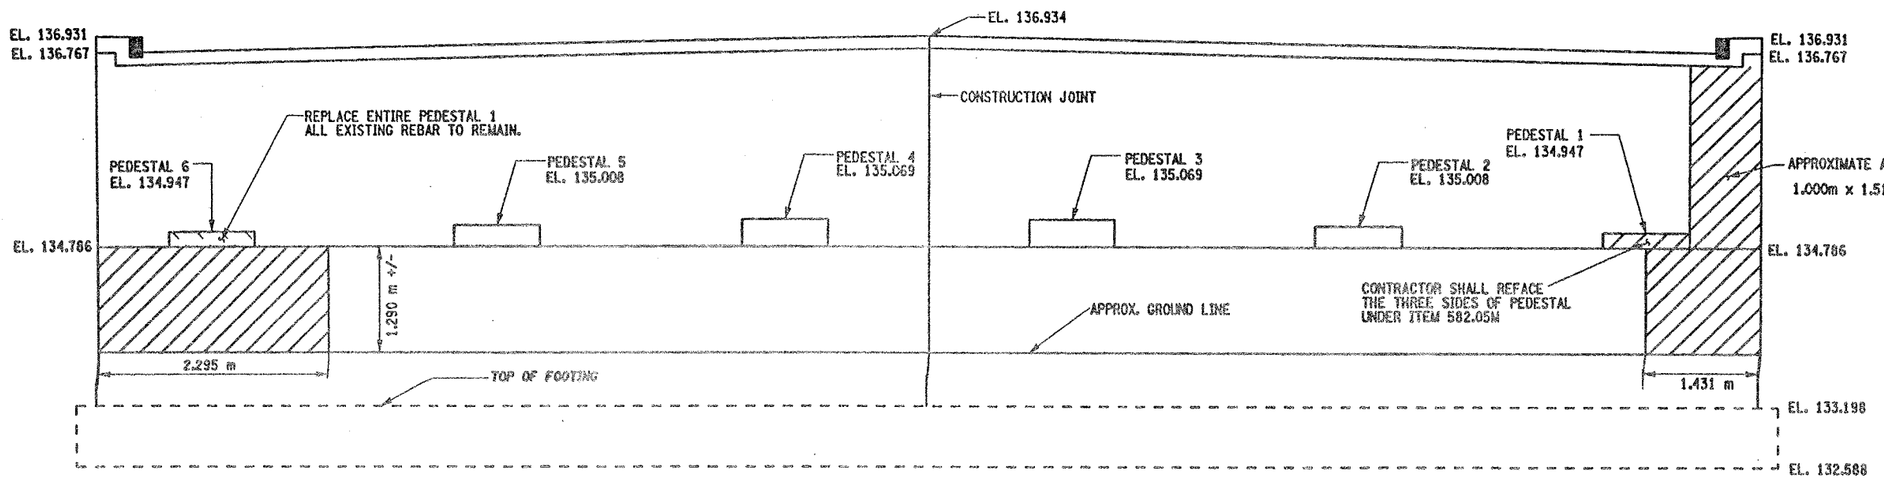
• PERFORM STRUCTURAL LIFTING UNDER ITEM 585.01M
STRUCTURAL LIFTING OPERATIONS TYPE A (LIFTING AT AN ABUTMENT)
JACKING LOADS:
D.L. = 50 MT
L.L. = 50 MT
TOTAL = 100 MT



ELEVATION
SCALE 1:30

LIST OF ITEMS USED:

ITEM 555.0105M - CONCRETE FOR STRUCTURES CLASS A (CM)
ITEM 15565.4302M - BRIDGE BEARING RESTORATION (EA)
ITEM 580.01M - REMOVAL OF STRUCTURAL CONCRETE (CM)
ITEM 585.01M - STRUCTURAL LIFTING OPERATIONS, TYPE A (EA)
ITEM 582.05M - REMOVAL OF STRUCTURAL CONCRETE REPLACEMENT WITH CLASS A CONCRETE (CM)

NOTES:

1. ALL DIMENSIONS SHOWN FOR CONCRETE REMOVAL ARE APPROXIMATE AND SHALL BE FIELD VERIFIED BY THE CONTRACTOR AND EIC.
2. REMOVE CONCRETE TO LIMITS SHOWN AS WELL AS TO SOUND CONCRETE, A.O.B.E.
3. WHEN REMOVING EXISTING CONCRETE, SAWCUT 5 mm MIN. TO PRODUCE NEAT REMOVAL LINES. ANY COST TO BE INCLUDED IN THE BID PRICE FOR ITEM 582.05M.
4. ALL EXISTING REINFORCEMENT TO REMAIN.
5. ELEVATIONS ARE GIVEN FOR QUANTITY ESTIMATES ONLY.
6. REFER TO CONTRACT D250094 FOR ORIGINAL CONSTRUCTION DETAILS.
7. FOR REMOVAL DETAIL SECTION A-A AND SECTION B-B SEE DWG AB7-2.

BRIDGE BEARING RESTORATION NOTES:

1. THE BRIDGE BEARING RESTORATION ITEM 15565.4302M SHALL INCLUDE ALL DESIGNATED WORK AS PER THE SPECIFICATION.
2. STRUCTURAL LIFTING SHALL BE USED WITH ALL EXPANSION BEARING RESTORATION.
3. IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER SPAN (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARINGS), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN SPECIFICATION SECTION 585- STRUCTURAL LIFTING OPERATIONS.
4. BEARING RESTORATION SHALL INCLUDE REPLACEMENT OF BRONZE PLATE.
5. FIXED BEARINGS TO BE CLEANED IN PLACE. DO NOT DISASSEMBLE.
6. SEE BR-7 FOR BEARING RESTORATION DETAILS.

AREAS OF PROPOSED WORK: ITEM 580.01M REMOVAL OF STRUCTURAL CONCRETE (CM), ITEM 555.0105M CONCRETE FOR STRUCTURES, CLASS A (CM)

AREAS OF PROPOSED WORK: ITEM 582.05M REMOVAL OF STRUCTURAL CONCRETE- REPLACEMENT WITH CLASS A CONCRETE

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the ramp from Interstate Route I-481 & I-90 over Interstate Route I-481. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the ramp from Interstate Route I-481 & I-90 over Interstate Route I-481. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072530 Ramp From Interstate Route I-481 & I-90 over Interstate Route I-481

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 25, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072530 (I-90/I-481 over I-481)

This memorandum summarizes the seismic screening conducted for BIN 1072530 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Seat width improvements are required at (Begin and End abutments). Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.9% in Span 1 and 1.2% in Span 2. The cores indicate the reinforcement steel is 2.75 inches to 3.5 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier, a new median barrier, and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $952,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier, a new median barrier, and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $1,332,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The begin joint is expansion. The compression seal appears to be in fair condition. There is a full length (10" long) hairline crack in the end header near the right side of the center lane (Photo 1). Otherwise, the headers are in good condition. Active leakage was noted below (Photo 2).	1,2
TP 349-26	Begin Abutment – Seats and Pedestals: There is a spall in the Bay 4 seat at the right front corner measuring 2.5’ x 9” x 3” deep with exposed rebar (Photo 3). There is a 1 sf adjacent area that is hollow sounding. There is 1/8” wide cracking and a 0.75 sf hollow area in the Bay 5 seat at the left (Photo 4). The right face of Pedestal 5 has a 0.5 sf hollow area. The remainder of the seats and pedestals are in good condition.	3,4
TP 349-27	End Abutment – Seats and Pedestals: The seats have some hairline to 1/32” wide cracking. The worst is in Bay 2 at the right (Photo 5). No hollow areas were noted. The pedestals have some hairline cracking on their vertical faces with no hollowness.	5
TP 349-28	Begin Abutment – Backwall: There is a 2’ wide x 6” hollow area at the top in Bay 2 (Photo 6). There is a 1 sf x 2” deep spall at the top right with exposed rebar (Photo 7). The remainder of the backwall has some hairline cracking and rust staining.	6,7
TP 349-30	Begin Abutment – Stem: There is a 2.5’ long x 7” high x 3” deep top corner spall with exposed rebar in Bay 4 (Photo 3). A 4” height below the spall is hollow. There are (3) hollow areas below Bay 5 totaling 8 sf (Photo 8). Bays 1 and 3 have horizontal cracking within 6” of the seat but the concrete sounded solid (Photo 9). The remainder of the stem is in good condition (Photo 10).	3, 8-10
TP 349-31	End Abutment – Stem: There is a 1.5’ high x 7” wide hollow area in Bay 1 at mid-height (Photo 11). The remainder of the stem surface has some hairline to 1/32” wide cracking which extends into the seat (Photos 5 and 12).	5,11,12

ITEM	REMARKS	PHOTO N0.
TP 350-20	Deck Elements - Curbs: The right concrete curb is in good condition. The left granite curb is displaced from the safety walk in several locations. (2) curb sections are separated 3”+/- at the joint located near Rail Post 8 of 15 (Photo 13). The curb sections are not separated at their other ends. Three other locations have a similar condition. The joint located between Rail Posts 5 and 6 has 1.75” separation at the end only (Photo 14). The joint located between Rail Posts 9 and 10 has 1.5” separation at the begin and 1” separation at the end (Photo 15). The joint located at Rail Post 11 has 1.75” separation at the begin and 1” separation at the end (Photo 16). No curbs have fallen into the travel lanes. The remainder of the left granite curb is in good condition with a few locations of missing grout.	14-16
TP 350-21	Deck Elements - Sidewalks and Fascias: Sidewalks: The left safety walk has light map cracking over most of its length but sounds solid (Photo 16). The right safety walk is in good condition.	16
	Fascias: Both fascias have map cracking throughout with no hollow sounding areas (Photo 17).	17
TP 350-22	Deck Elements – Railings/Parapets The bridge railing and posts are in good condition. Snow fencing is present over the travel lanes on both sides of the bridge. The snow fence consists of 7 steel pipe posts located at rail posts, steel pipe rails, and chain link fencing. On the left the bottom pipe rail at Post 3 is rusted through and detached on the end side (Photo 17). The bottom rails at Posts 2, 4, and 5 are rusted but intact. On the right the bottom pipe rails at Posts 3-6 are rusted through and detached on one or both sides. The bottom rails at Post 2 are rusted but intact. The remainder of the snow fencing is in good condition.	17
TP 350-27	Superstructure – Structural Deck The structural deck is an 8.5" thick concrete mono deck with SIP forms. There is a 3' long 1/8" wide crack at the begin in the right portion of the center lane with a 15” x 3" x 1" deep spall along it (Photo 1). There are (3) hollow areas as shown in the Deck Deterioration Plan (Photo 18). The right lane has scattered hairline cracking. Overall, 0.4% of the deck is hollow. The deck has SIP forms, and the underside is exposed only at the overhangs. The overhangs have hairline cracking at +/-2’ spacing throughout (Photo 19). The SIP forms are in good condition except for a 2’ length missing in Bay 2 near the end (Photo 20).	1, 18-20

ITEM	REMARKS	PHOTO N0.
TP 350-28	Superstructure – Primary Members: The steel girders are in good condition with no significant section loss (Photo 21 and 22).	21,22
TP 350-30	Superstructure – Paint: The girders are made of weathering steel and form a protective coating. The bottom face of the right fascia girder bottom flange is losing its coating in the form of medium sized flakes on the outside 3” (Photo 21). The remainder of the steel on all of the girders has only minor peppering with locations of small flaking (Photo 22).	21,22

	Total (Ft.)	.523	.697	.523

CAMBER NOTES

The total camber as tabulated is assumed to be measured vertically to the top of full camber web from a straight line drawn from the intersection of top of web and centerline of bearings at one end of the girder to the intersection of top of web and centerline of bearings at the other end of the girder.

The camber labeled "Vertical Curve" in the table is the camber required in the girder to cause the girder to follow the vertical curve.

The camber labeled "Steel D.L." in the table is the camber required in the girder to offset the deflection due to the dead load weight of the steel in the girder.

The camber labeled "Concrete D.L." in the table is the camber required in the girder to offset the deflection due to the dead load weight of the concrete slab.

The camber labeled "Superimposed D.L." in the table is the camber required in the girder to offset the deflection due to the weight of the superimposed dead load, that is, the curb, sidewalk, railing and future wearing surface

Cambers listed in the table as positive are upward cambers.

Cambers listed in the table as negative are downward cambers.

The cambers are tabulated in decimals of a foot.

DESIGN LOAD TABLE/GIRDER

	UNIT	LOAD/FT
DL	Slab	1.009 K/Ft.
	Haunch	0.047 K/Ft.

PROJECT LOCATION

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 4811-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 4811-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

AREAS OF PROPOSED WORK: ITEM 582.05M REMOVAL OF STRUCTURAL CONCRETE- REPLACEMENT WITH CLASS A CONCRETE

NOTES:

1. ALL DIMENSIONS SHOWN FOR CONCRETE REMOVAL ARE APPROXIMATE AND SHALL BE FIELD VERIFIED BY THE CONTRACTOR AND EIC.
2. REMOVE CONCRETE TO LIMITS SHOWN AS WELL AS TO SOUND CONCRETE, A.O.B.E.
3. WHEN REMOVING EXISTING CONCRETE, SAWCUT 5 mm MIN. TO PRODUCE NEAT REMOVAL LINES. ANY COST TO BE INCLUDED IN THE BID PRICE FOR ITEM 582.05M.
4. ALL EXISTING REINFORCEMENT TO REMAIN.
5. ELEVATIONS ARE GIVEN FOR QUANTITY ESTIMATES ONLY.
6. REFER TO CONTRACT D250094 FOR ORIGINAL CONSTRUCTION DETAILS.
7. FOR REMOVAL DETAILS SEE DWG. AB8-2.

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

INFORMATIONAL NOTES:

BIN 1072530 - NO JOINT AT PIER.

BIN 1072791 - REPLACE COMPRESSION SEALS
BEG. ABUT. (EAST), TYPE A-5
END ABUT. (WEST), TYPE A-1

FOR JOINT DETAILS REFER TO THE FOLLOWING DRAWINGS:

DWG. NO. JD-1 - MODIFIED ARMORED COMPRESSION SEAL JOINT SYSTEM.
DWG. NO. JD-24 - ONE-CELL MODULAR JOINT SYSTEM.
DWG. NO. JD-25 - TWO-CELL MODULAR JOINT SYSTEM.

LIST OF BRIDGE JOINT ITEMS USED:

ITEM 566.01M - MODULAR EXP. JOINT SYSTEM ONE-CELL (M)
ITEM 566.02M - MODULAR EXP. JOINT SYSTEM TWO-CELL (M)
ITEM 567.31M - MODIFIED ARMORED JOINT SYSTEM W/ COMP. SEAL TYPE A1 (m)

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over Route 298. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over Route 298. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072571 Interstate Route I-481 South Bound over Route 298

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072571 (I-481 SB/RT 298)

This memorandum summarizes the seismic screening conducted for BIN 1072571 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.4% of the total deck surface area. The cores indicate the reinforcement steel is 2.5 inches to 3.0 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at two sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $533,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $745,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The begin joint is expansion. The visible portion of the compression seal is detached from the header for most of the joint length (Photo 1). The headers are in good condition. There is evidence of recent leakage underneath in the form of rust staining on the seats and backwall (Photo 2).	1,2
TP 349-23	End Abutment - Joint with Deck: The end joint is fixed. The seal and headers are in good condition. There is evidence of recent leakage underneath in the form of rust staining on the seats and backwall (Photo 3).	3
TP 349-24	Begin Abutment – Bearings: The bearings are expansion high rockers. The 2012 Biennial Inspection Report rated Begin Abutment – Bearings 4 due to delamination on the plates and rocker on Bearing 5. The bearing has some pack rust under the rockers but appears to be functioning properly (Photo 24). The remainder of the bearings are in better condition with only minor rusting.	24
TP 349-26	Begin Abutment – Seats and Pedestals: Pedestal 1 has a 6” square x 2” deep spall with no exposed rebar (Photo 4). The left face of Pedestal 2 has a 1/16” wide x 15” long crack but does not sound hollow (Photo 2). The remaining seats and pedestals have some hairline cracking.	2,4
TP 349-27	End Abutment – Seats and Pedestals: Fascia Pedestal 5 has a 1/16” wide crack on its left face with no hollowness (Photo 5). The remainder of the seats and pedestals have scattered hairline cracking (Photo 6).	5,6
TP 349-28	Begin Abutment – Backwall: There is a 6’ long x 1’ high max. x 1.5” deep spall in Bay 1 at the top right (Photo 7). Bay 2 at the center top has a 2’ long x 5” high x 1” deep spall (Photo 8). There is a 1’ wide x 6” high x 2” deep spall at the top right (Photo 9). The remainder has rust staining and hairline cracking.	7-9
TP 349-30	Begin Abutment – Stem: There is a hollow area at the bottom under Bay 1 measuring 13” wide x 8” visible height (Photo 10). Some 1/16” wide cracking was noted around previously patched areas under Bay 3 (Photo 11). The remainder has isolated locations of hairline cracking (Photo 12).	10-12
TP 349-31	End Abutment – Stem: There are (2) hollow areas at the bottom under Bay 1 measuring 21” wide x 26” visible height and 7” wide x 17” visible height (Photo 13). There is 1/32” wide cracking in Bays 2 and 4 which extends into the seat (Photo 6). The remainder has isolated locations of hairline cracking and staining (Photo 14).	6,13,14

ITEM	REMARKS	PHOTO N0.
TP 350-21	Deck Elements - Sidewalks and Fascias: Sidewalks: Both safety walks have light map cracking but sound solid (Photo 15). Fascias: Both fascias have map cracking throughout and sound solid (Photo 16).	15 16
TP 350-22	Deck Elements – Railings/Parapets The bridge railing and posts are in good condition. Snow fencing is present over the travel lanes on both sides of the bridge. The snow fence consists of steel pipe posts located at rail posts, steel pipe rails, and chain link fencing. There are 8 posts on the left and 7 on the right. On the left the bottom pipe rails at Posts 3, 5, and 7 are rusted through and detached on one or both sides. The bottom rails at Posts 2, 4, and 6 are rusted but intact. On the right the bottom pipe rails at Posts 3, 4, and 6 are rusted through and detached on one or both sides (Photo 17). The bottom rails at Posts 2 and 5 are rusted but intact. The remainder of the snow fencing is in good condition.	17
TP 350-27	Superstructure – Structural Deck The structural deck is an 8.5" thick concrete mono deck with SIP forms. No hollow or cracked areas were found (Photo 18). There is one patch in the right lane near the centerline of roadway adjacent to the begin joint with deck header (Photo 19). The patch is 6.5' wide x 8" long and is in good condition. See Deck Deterioration Plan. The deck has SIP forms, and the underside is exposed only at the overhangs. The left overhang has hairline cracking at +/-2.5’ spacing throughout (Photo 20). The right overhang is in good condition. The SIP forms are in good condition except for 3 locations of missing forms. There is a 2’ length missing in Bay 3 near midspan (Photo 21). Near the end there is a 2’ length missing in Bay 2 and a 5’ length missing in Bay 3 (Photo 22). The exposed concrete at these locations is in good condition.	18-22
TP 350-28	Superstructure – Primary Members: The steel girders are in good condition with no significant section loss (Photo 23).	23
TP 350-30	Superstructure – Paint: The girders are made of weathering steel and form a protective coating. There are some locations where the coating is coming off in the form of small flakes (Photo 23). The remainder is in good condition.	23

DIAPHRAGMS NOTES:

Where holes are indicated, connections shall be 7/8" diameter high-strength bolts.

Cross frames may be fabricated to fit the girders in their erected position and cambered shape, but deflected vertically under the dead load of the steel work only.

The Contractor may place diaphragms on the side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment provided the work will be in accordance with other structural details.

Snipe the outstanding leg of all angles and plates 1" minimum.

Tapered or flat shim plates may be used in the connection between skewed diaphragms and the bearing stiffeners or stiffener connection plates. Variable thicknesses of shim plates may be used. The minimum thickness of shim plate shall be 1/8" with a maximum number of three shim plates permitted at any connection. The total thickness of all shim plates used at any connection shall not exceed 1". Shim plates shall have the dimensions of the faying surface. The shim material shall conform to ASTM Designation A36, except that on unpainted structures, the shim material shall conform to ASTM Designation A588. No additional payment will be made for furnishing and placing the shim plates.

Both the gusset plate and flange are to be same type of steel.

Field welding to the gusset plate will not be permitted.

	(SI) Superimposed D.L. (ft.)	.077	.103	.077
	Total (ft.)	.523	.697	.523

CAMBER NOTES

The total camber as tabulated is assumed to be measured vertically to the top of full camber web from a straight line drawn from the intersection of top of web and centerline of bearings at one end of the girder to the intersection of top of web and centerline of bearings at the other end of the girder.

The camber labeled "Vertical Curve" in the table is the camber required in the girder to cause the girder to follow the vertical curve.

The camber labeled "Steel D.L." in the table is the camber required in the girder to offset the deflection due to the dead load weight of the steel in the girder.

The camber labeled "Concrete D.L." in the table is the camber required in the girder to offset the deflection due to the dead load weight of the concrete slab.

The camber labeled "Superimposed D.L." in the table is the camber required in the girder to offset the deflection due to the weight of the superimposed dead load, that is, the curb, sidewalk, railing and future wearing surface.

Cambers listed in the table as positive are upward cambers.

Cambers listed in the table as negative are downward cambers.

The cambers are tabulated in decimals of a foot.

PROJECT LOCATION

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481I-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481I-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over Route 298. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over Route 298. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072572 Interstate Route I-481 North Bound over Route 298

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072572 (I-481 NB/ RT 298)

This memorandum summarizes the seismic screening conducted for BIN 1072572 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.1% of the total deck surface area. The cores indicate the reinforcement steel is 3.5 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at two of the three sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $483,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $667,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: This is the expansion end. Active leakage and rust staining was noted below (Photos 2 and 3). The seal and headers appeared in good condition from above (Photo 1).	1-3
TP 349-23	End Abutment - Joint with Deck: This is the fixed end. The compression seal is slightly torn in the left lane and has lost its bond from the steel armor angles (Photo 4). The headers are in good condition. No active leakage or significant rust staining was noted below (Photo 5).	4,5
TP 349-27	End Abutment - Seats and Pedestals: Pedestal 1 has a 1’ x 8” x 5” deep spall with rebar exposed at the begin left corner (Photo 6). There is an adjacent 1 sf hollow area on its begin face. The seat at the left corner has a 6” diameter x 1.5” deep spall with no rebar exposed. The remainder of the seats and pedestals are in good condition.	6
TP 349-28	Begin Abutment - Backwall: The backwall at the right has a 15" wide x 6” high x 2.5" deep spall at the top (Photo 7). There is also a 20” high x 5” wide x 1” deep spall at the top left (Photo 8). The remainder has vertical hairline cracking and moderate rust staining mostly at the ends (Photo 3).	3,7,8
TP 349-30	Begin Abutment – Stem There is a 3.5 sf hollow area and a 1/8” wide x 2.5’ long horizontal crack in Bay 1 (Photo 9). The crack is 4” from the top and does not sound hollow. There is a 16” wide x 3’ high hollow area under Pedestal 3 at the bottom (Photo 10). There is a 0.5 sf hollow area under Pedestal 5 at the bottom (Photo 11). The remainder of the stem has areas of light cracking with no hollowness (Photo 12).	9-12
TP 349-31	End Abutment – Stem The stem is in good condition with isolated hairline vertical cracking and no hollow areas (Photo 13).	13
TP 350-20	Deck Elements - Curbs: The 2012 Biennial Inspection Report rated the Curb item 4 due to debris built-up along the approach curbs. Approach condition is out of the scope of this project, and bridge curbs are in good condition.	14
TP 350-21	Deck Elements - Sidewalks/Fascias: Sidewalks: Snow covered the curbs and safety walks at the time of the inspection. The snow was cleared at the begin and end and at a few locations along the span. The right safety walk had map cracking where visible, but no hollow sounding areas were found (Photo 14). No map cracking was found where the snow was cleared on the left safety walk.	14

ITEM	REMARKS	PHOTO N0.
TP 350-21	Fascias: Both fascias have map cracking throughout the span (Photo 15). The map cracking is worse under the rail posts. The right fascia has +/-2.5' long x 1/16" wide longitudinal cracking under the rail posts near the bottom (Photo 16). No spalling or hollow sounding areas were found.	15,16
TP 350-22	Deck Elements - Railings/Parapets: The bridge railing and posts are in good condition. Snow fencing is present over the travel lanes on both sides of the bridge. The snow fence consists of 6 steel pipe posts (located at rail posts), steel pipe rails, and chain link fencing. On the left the bottom pipe rails at Posts 2, 4, and 5 are rusted through and detached on the end side (Photo 17). On the right the bottom pipe rail at Post 4 is rusted through and detached on the begin side. The remainder of the bottom connections to snow fence Posts 2-5 on both sides have surface rust and section loss but are intact. The remainder of the snow fencing is in good condition.	17
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. There are several hollow areas and 3 patches in the top surface of the deck as illustrated in the Deck Deterioration Plan (Photos 4, 18, and 19). Overall, 1.9% of the deck is hollow or patched. The underside has SIP forms and is exposed only at the overhangs (Photo 20). The forms are in good condition. The overhangs have hairline cracking at +/-6' spacing and no hollow sounding areas (Photo 21).	4,18-21
TP 350-28	Superstructure - Primary Members: Girder 1 has (2) impact notches at the left corner of the bottom flange near midspan (Photos 22 and 23). The notches measure 1" and 2" long, are less than ¼" deep, and do not create any significant increase in stress. Otherwise the steel girders are in good condition with no significant section loss.	22,23
TP 350-30	Superstructure - Paint: The girders are made of weathering steel and form a protective coating. Both fascia girders are losing their coating in the form of medium sized sheets on their bottom flange bottom faces for the outside 1/3 width (Photo 25). Right fascia Girder 5 is also affected on the top right face of the bottom flange and lower 3" of the web with coating loss in the form of large sheets (Photo 24). The remainder of the steel on all of the girders has only minor peppering (Photo 20).	20 24,25

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481I-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481I-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

ALL WORK CONTEMPLATED UNDER THIS CONTRACT IS TO BE COVERED BY AND IN CONFORMITY WITH THE STANDARD SPECIFICATIONS (METRIC UNITS) OF JANUARY 2, 2002, AS AMENDED BY ADDENDA NOS. 1 AND 2, EXCEPT AS MODIFIED ON THESE PLANS AND IN THE ITEMIZED PROPOSAL.

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

INFORMATIONAL NOTES:

BIN 1072530 - NO JOINT AT PIER.

BIN 1072791 - REPLACE COMPRESSION SEALS
BEG. ABUT. (EAST), TYPE A-5
END ABUT. (WEST), TYPE A-1

FOR JOINT DETAILS REFER TO THE FOLLOWING DRAWINGS:

DWG. NO. JD-1 - MODIFIED ARMORED COMPRESSION SEAL JOINT SYSTEM.

REMOVAL NOTE:

EXISTING EPOXY COATED REINF. BARS ENCOUNTERED AT THE JOINT BLOCK-OUTS, SHALL REMAIN. CARE SHALL BE TAKEN DURING REMOVAL OPERATIONS, NOT TO DAMAGE THE REINFORCEMENT BARS.

PRIOR TO PLACEMENT OF NEW CONCRETE THE EXISTING EPOXY BARS SHALL BE CLEANED AND ANY FIELD REPAIRS DEEMED NECESSARY BY THE ENGINEER, BE MADE AS PER SECTION 556-3.02(C) OF STANDARD SPECIFICATIONS. TO BE INCLUDED IN PRICE BID FOR ITEM 580.01M.

NOTES:

1. ACTUAL BRIDGE JOINT BLOCK-OUT DIMENSIONS MAY VARY. REMOVAL LIMITS SHALL BE TO EXISTING BLOCK-OUT LOCATIONS, AOBE.
2. EXISTING WATERSTOPS SHALL REMAIN.
3. FOR CALCULATION OF "A" DIMENSION REFER TO DWG. NO. JD-1.
4. REFER TO DWG. NO. JD-35 FOR PROPOSED PARTIAL PLAN VIEWS.
5. ALL WELDS SHALL BE GROUND SMOOTH TO THE SATISFACTION OF THE ENGINEER, ON SEAL CONTACT SIDE OF EDGE BEAM.
6. REFER TO DWG. NO. JD-1 FOR PROPOSED JOINT DETAILS AND ALL NOTES SHALL APPLY.
7. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NOMINAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6 mm NOR MORE THAN 19 mm BELOW THE TOP OF ROADWAY.
8. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACES AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE FOR 12 HOURS. NOTE, THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, (PROJECT PROPOSAL).

ITEMS USED:

ITEM 555.09M - STRUCT. CONCRETE, CLASS "HP" (CM)

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over Taft Road. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over Taft Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072581 Interstate Route I-481 South Bound over Taft Road

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 20, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072581 (I-481 SB / Taft Rd)

This memorandum summarizes the seismic screening conducted for BIN 1072581 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 1.9% of the total deck surface area. The cores indicate the reinforcement steel is 2.75 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $415,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $567,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: This is the expansion end. Active leakage and rust staining was noted below (Photos 2 and 3). The seal and headers appeared in good condition from above (Photo 1).	1-3
TP 349-26	Begin Abutment - Seats and Pedestals: There is map cracking on the right face of Pedestal 1 (Photo 3) and a 1/16” horizontal crack on the right face of Pedestal 3 (Photo 4). These areas did not sound hollow. The remainder of the seats and pedestals are in good condition.	3,4
TP 349-27	End Abutment - Seats and Pedestals: The front face of Pedestal 5 sounds hollow for a 2’ wide x full height area (Photo 5). The top face is hollow for the begin 7” with a 3/8” wide crack extending from the masonry plate to the right corner. The remainder of the seats and pedestals are in good condition.	5
TP 349-28	Begin Abutment - Backwall: The backwall has a 5" wide x 3” high x 1.5" deep spall at the top behind Girder 1 (Photo 6). The remainder has vertical hairline cracking and moderate rust staining mostly at the ends (Photos 2 and 7).	2,6,7
TP 349-30	Begin Abutment – Stem There are (3) hollow areas in the lower stem face under Girder Bay 4 totaling 5.75 sf (Photos 8 and 9). The remainder of the stem has areas of patching with no hollowness.	8,9
TP 349-31	End Abutment – Stem There is one 3 sf hollow area just to the left of Pedestal 1 at the bottom (Photos 10 and 11). The remainder of the stem has areas of light cracking with no hollowness.	10,11
TP 350-20	Deck Elements - Curbs: One curb section on the left is displaced toward the roadway 1" at its end but seems stable (Photo 12). The location is 76' from the begin. The remainder of the left curb and the entire right curb is in good condition with some areas of missing grout. The 2012 Biennial Inspection Report rated the Curbs item 4 due to debris build-up and ponding along the approach curbs. Approach condition is outside the scope of this project.	12
TP 350-21	Sidewalks/Fascias: Sidewalks: Snow covered the curbs and safety walks at the time of the inspection. The snow was cleared at the begin and end and at a few locations along the span. The left safety walk had map cracking where visible, but no hollow sounding areas were found (Photo 13). No map cracking was found where the snow was cleared on the right safety walk.	13

ITEM	REMARKS	PHOTO N0.
TP 350-21	Fascias: Both fascias have map cracking throughout the span (Photo 14). The map cracking is worse under the rail posts. There are +/-2.5' long hairline to 1/16" wide longitudinal cracks under the rail posts at the bottom chamfers on both sides. No spalling or hollow sounding areas were found on the vertical faces.	14
TP 350-22	Deck Elements - Railings/Parapets: The bridge railing and posts are in good condition. Snow fencing is present over the travel lanes on both sides of the bridge. The snow fence consists of 6 steel pipe posts (located at rail posts), steel pipe rails, and chain link fencing. On the right the bottom pipe rails at Posts 2 and 3 are rusted through and detached on the begin side. The bottom pipe rails at Post 4 are rusted through and detached on the begin and end side (Photo 15). On the left the bottom pipe rail at Post 5 is rusted through and detached on the begin side. The remainder of the bottom connections to snow fence Posts 2-5 on both sides have surface rust and section loss but are intact. The remainder of the snow fencing is in good condition.	15
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. The surface of the deck has several hollow areas and patches that range from good to fair condition (Photos 16 to 17). There is a 15' long x 5' wide patch near the begin in the right lane which has hollowness surrounding it and transverse hairline cracking throughout (Photo 18). There is also a 1' wide x 6" long x 1.5" deep spall adjacent to the patch on the end side. Overall, 12% of the deck is patched or damaged. See Deck Deterioration Plan. The deck has SIP forms, and the underside is exposed at the overhangs. There is a 2' long x 1' wide x 2" deep spall under the last snow fence post on the left (Photo 19). The rail post anchor bolt and anchor plate are partially exposed. There is a shallower adjacent spall measuring 1' long x 4" wide x ½" deep with no exposed rebar. The spalls both sound solid. Under the third last rail post on the left there is a 9" dia,. x 1" deep spall with an adjacent 1' x 6" hollow area (Photo 20). The remainder of both overhangs have hairline cracking at +/-6' spacing (Photo 21). The SIP forms are in good condition except for a 2' length missing 2' from the begin in Bay 4 (Photo 22). The exposed concrete at this location is in good condition.	16-22
TP 350-28	Superstructure - Primary Members The steel girders are in good condition with no significant section loss (Photos 23 and 24).	23,24

FEATURE CARRIED: I-481 NB
FEATURE CROSSED: TAFT RD

TEAM LEADER: A.THOMPSON
A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 350-30	Superstructure - Paint: The girders are made of weathering steel and form a protective coating. Both fascia girders are losing their coating in the form of medium sized sheets on their bottom flange bottom faces for the outside half width (Photo 23). The fascia girders are similarly affected on the top inside face of the bottom flange and lower 3" of the web (Photo 24). This condition is worse over the end half of the span. The remainder of the steel on all of the girders has only minor peppering.	23,24

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481I-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481I-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

ALL WORK CONTEMPLATED UNDER THIS CONTRACT IS TO BE COVERED BY AND IN CONFORMITY WITH THE STANDARD SPECIFICATIONS (METRIC UNITS) OF JANUARY 2, 2002, AS AMENDED BY ADDENDA NOS. 1 AND 2, EXCEPT AS MODIFIED ON THESE PLANS AND IN THE ITEMIZED PROPOSAL.

REMOVAL DETAIL

NOT TO SCALE

NOTES:

1. ALL DIMENSIONS SHOWN FOR CONCRETE REMOVAL ARE APPROXIMATE AND SHALL BE FIELD VERIFIED BY THE CONTRACTOR AND E.I.C.
2. REMOVE CONCRETE TO LIMITS SHOWN AS WELL AS TO SOUND CONCRETE, A.O.B.E.
3. WHEN REMOVING EXISTING CONCRETE, SAWCUT 5mm MIN. TO PRODUCE NEAT REMOVAL LINES. ANY COST TO BE INCLUDED IN THE BID PRICE FOR ITEM 582.05 M
4. ALL EXISTING REINFORCEMENT TO REMAIN.
5. ELEVATIONS ARE GIVEN FOR QUANTITY ESTIMATES ONLY.
6. REFER TO CONTRACT D250094 FOR ORIGINAL CONSTRUCTION DETAILS.

LEGEND:

AREAS OF PROPOSED WORK: ITEM 582.05M REMOVAL OF STRUCTURAL CONCRETE REPLACEMENT WITH CLASS A CONCRETE

AREAS OF PROPOSED WORK: ITEM 580.01M REMOVAL OF STRUCTURAL CONCRETE (CM), ITEM 555.0105M CONCRETE FOR STRUCTURES, CLASS A (CM)

BRIDGE BEARING RESTORATION NOTES:

1. THE BRIDGE BEARING RESTORATION ITEM 15565.4302M SHALL INCLUDE ALL DESIGNATED WORK AS PER THE SPECIFICATION.
2. STRUCTURAL LIFTING SHALL BE USED WITH ALL EXPANSION BEARING RESTORATION.
3. IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER SPAN (TO A MAXIMUM OF 3 nos TO REMOVE LOAD FROM BEARINGS), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN SPECIFICATION SECTION 585- STRUCTURAL LIFTING OPERATIONS.
4. BEARING RESTORATION SHALL INCLUDE REPLACEMENT OF BRONZE PLATE.

* PERFORM STRUCTURAL LIFTING UNDER ITEM 585.01M STRUCTURAL LIFTING OPERATIONS TYPE A (LIFTING AT AN ABUTMENT).

JACKING LOADS:
D.L. = 50 MT
L.L. = 50 MT
TOTAL = 100 MT

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

INFORMATIONAL NOTES:

BIN 1072530 - NO JOINT AT PIER.

BIN 1072791 - REPLACE COMPRESSION SEALS
BEG. ABUT. (EAST), TYPE A-5
END ABUT. (WEST), TYPE A-1

FOR JOINT DETAILS REFER TO THE FOLLOWING DRAWINGS:

DWG. NO. JD-1 - MODIFIED ARMORED COMPRESSION SEAL JOINT SYSTEM.
DWG. NO. JD-24 - ONE-CELL MODULAR JOINT SYSTEM.
DWG. NO. JD-25 - TWO-CELL MODULAR JOINT SYSTEM.

LIST OF BRIDGE JOINT ITEMS USED:

ITEM 566.01M - MODULAR EXP. JOINT SYSTEM ONE-CELL (M)
ITEM 566.02M - MODULAR EXP. JOINT SYSTEM TWO-CELL (M)
ITEM 567.31M - MODIFIED ARMORED JOINT SYSTEM W/ COMP. SEAL TYPE A1 (m)

REMOVAL NOTE:

EXISTING EPOXY COATED REINF. BARS ENCOUNTERED AT THE JOINT BLOCK-OUTS, SHALL REMAIN. CARE SHALL BE TAKEN DURING REMOVAL OPERATIONS, NOT TO DAMAGE THE REINFORCEMENT BARS.

PRIOR TO PLACEMENT OF NEW CONCRETE THE EXISTING EPOXY BARS SHALL BE CLEANED AND ANY FIELD REPAIRS DEEMED NECESSARY BY THE ENGINEER, BE MADE AS PER SECTION 556-3.02(C) OF STANDARD SPECIFICATIONS. TO BE INCLUDED IN PRICE BID FOR ITEM 580.01M.

NOTES:

1. ACTUAL BRIDGE JOINT BLOCK-OUT DIMENSIONS MAY VARY. REMOVAL LIMITS SHALL BE TO EXISTING BLOCK-OUT LOCATIONS, AOBE.
2. EXISTING WATERSTOPS SHALL REMAIN.
3. FOR CALCULATION OF "A" DIMENSION REFER TO DWG. NO. JD-1.
4. REFER TO DWG. NO. JD-37 FOR PROPOSED PARTIAL PLAN VIEWS.
5. ALL WELDS SHALL BE GROUND SMOOTH TO THE SATISFACTION OF THE ENGINEER, ON SEAL CONTACT SIDE OF EDGE BEAM.
6. REFER TO DWG. NO. JD-1 FOR PROPOSED JOINT DETAILS AND ALL NOTES SHALL APPLY.
7. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NOMINAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6 mm NOR MORE THAN 19 mm BELOW THE TOP OF ROADWAY.
8. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACES AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE FOR 12 HOURS. NOTE, THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, (PROJECT PROPOSAL).

ITEMS USED:

ITEM 555.09M - STRUCT. CONCRETE, CLASS "HP" (CM)
ITEM 556.0202M - EPOXY-COATED BAR REINF. FOR STRUCT. (Kg)
ITEM 18567.46M - ELASTOMERIC CONCRETE FOR BRIDGE JOINT SYSTEMS (M)
ITEM 580.01M - REMOVAL OF STRUCT. CONCRETE (CM)

ALL DIMENSIONS ARE IN mm UNLESS OTHERWISE NOTED

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over Taft Road. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over Taft Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 20, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072582 (I-481 NB / Taft Rd)

This memorandum summarizes the seismic screening conducted for BIN 1072582 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 12.3% of the total deck surface area. The cores indicate the reinforcement steel is 2.5 inches to 2.75 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $496,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $567,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The previously spalled begin concrete header has been recently repaired with concrete patching material and is in good condition (Photo 1). The seal is partially torn in the right lane for most of its length. Underneath, the steel rod shaped armor material to the end of the compression seal is detached (Photo 2). Rust staining and other signs of recent leakage were noted.	1,2
TP 349-23	End Abutment - Joint with Deck: The seal is partially detached from the end angle in the left lane and appears detached sporadically throughout (Photo 3). The end header is spalled for the right 1' (Photo 4) and for an 8" x 2' wide triangular area at the left (Photo 5). The armor angles and the remainder of the headers are in good condition. Rust staining and recent leakage was noted underneath (Photo 6).	3-6
TP 349-24	Begin Abutment – Bearings: The begin abutment has expansion high rocker type bearings. Bearing 1 was under extended +/-1.5” at 28 degrees F (Photo 7). The 2012 inspection report indicates it was under extended 3” at 60 degrees F. The remainder of the bearings are in a position close to neutral. No other defects were noted.	7
TP 349-26	Begin Abutment – Seats and Pedestals The front left corner of Pedestal 1 has a 1 sf cracked hollow area (Photo 8). Most of the seat at the left has hairline cracking with no hollowness. The remainder of the pedestals have hairline cracking on their vertical faces with no hollowness (Photo 9). The seat at the right has a 2” deep x 10” wide x full length spall with surrounding concrete loose (Photo 9).	8,9
TP 349-27	End Abutment – Seats and Pedestals The back +/-1’ of all pedestals is stained and hollow sounding (Photo 6). The front 4” to 8” of the seat in Bay 1 is cracked and hollow for a width of 3.5’ (Photo 10). The seat at the left has a 1 sf hollow area with light spalling (Photo 11).	6,10,11
TP 349-28	Begin Abutment – Backwall The backwall at the top left has a 0.5 sf x 1” deep spall with no exposed rebar (Photo 12). The remainder of the backwall has moderate hairline cracking and rust staining with active leakage (Photos 7-9). Conditions are more severe at both ends.	7-9 12
TP 349-29	End Abutment – Backwall The backwall at the top left has 1 sf x 2” deep spall with 2 sf of hollowness surrounding it (Photo 13). No exposed rebar was noted. The remainder of the backwall has moderate hairline cracking and rust staining with active leakage. Conditions are more severe at both ends.	13

FEATURE CARRIED: I-481 SB
FEATURE CROSSED: NORTHERN BLVD.

TEAM LEADER: A.THOMPSON
A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 349-30	Begin Abutment – Stem The begin stem has several hollow areas throughout (Photo 14). Two 2” deep spalls were found. The sum of the hollow and spalled areas is 86 sf or 16% of the stem face. These conditions are detailed on the Abutment Deterioration Sketch.	14
TP 349-31	End Abutment – Stem There is a full height x 1’-2” wide x 4” deep max. spall at the right with exposed rebar (Photo 15). The concrete in the spall is soft and there is an adjacent 2’ wide hollow area. There is a 5’ high, 8 sf hollow area located 3.5’ from the left (Photo 16). At the top of the stem there is a 0.5 sf hollow area between Pedestals 1 and 2 (Photo 10). The remainder of the stem has isolated hairline cracking and is in good condition.	10,15 16
TP 350-20	Deck Elements - Curbs: The left granite curb has some mortar loss but is solid and in place. The first 1' of the right granite curb has detached from the rest of the section but has not displaced (Photo 17). There are (2) 6' sections which have displaced inward at their begin ends. The section starting 49' from the begin has displaced 1.5" (Photo 18), and the section starting at 61' from the begin has displaced 2" (Photo 19). The remainder of the right curb has some mortar loss but is in place and solid.	17-19
TP 350-21	Deck Elements - Sidewalks/Fascias: Sidewalks: The first 24' of the left safety walk is moderately map cracked (Photo 20). It has a full width x 3" spall at the begin with loose concrete surrounding it (Photo 21). The entire right safety walk has light map cracking (Photos 18 and 19). There is a triangular patch at the begin which is in good condition (Photo 17). Fascias: Both fascias have map cracking throughout with no spalling or hollow sounding areas (Photo 22). There are longitudinal cracks at the bottom under the rail posts (Photo 23). The cracks are 1/32” wide max and 2.5’ long max. There are 2 locations of light scaling to the begin of Post 3 on the left 18” long x 3” high and 6” long x 2” high (Photo 24).	17-21 22-24

ITEM	REMARKS	PHOTO N0.
TP 350-22	Deck Elements - Railings/Parapets: The bridge railing and posts are in good condition. Snow fencing is present over the travel lanes on both sides of the bridge. The snow fence consists of 14 steel pipe posts (located at rail posts), steel pipe rails, and chain link fencing. On the left the bottom pipe rails at Posts 2, 3, 6 - 11, and 13 are rusted through and detached on one or both sides (Photo 25 typ.). The bottom rails at Posts 4, 5, and 12 are rusted but intact. On the right the bottom pipe rails at Posts 2, 4, 6, 8, 10, and 13 are rusted through and detached on one or both sides. The bottom rails at Posts 3, 5, 7, 9, 11, and 12 are rusted but intact. The remainder of the snow fencing is in good condition.	25
TP 350-27	Superstructure – Structural Deck The structural deck is an 8.5" thick concrete mono deck with SIP forms. The right lane is in good condition except for a 1' x 1' hollow area near the end at the left. The left lane has areas of hollowness including a 24 sf area near the end right (Photos 26 and 27). There are also 2 patches which are in good condition. See Deck Deterioration Plan. The underside has SIP forms and is exposed only at the overhangs (Photo 28). The SIP forms are in good condition. Both overhangs have map cracking and transverse hairline cracking throughout (Photo 29).	26-29
TP 350-30	Superstructure – Paint The girders are made of weathering steel and form a protective coating. Fascia girder G1 is losing its coating in the form of small flakes on the underside of its bottom flange (Photo 30). Fascia girder G5 on the underside of its bottom flange is similar but more severe with medium sized flakes (Photo 31). The outside face of its web is also losing its coating in the form of medium sized flakes (Photo 32). The remainder of the steel surfaces has only minor peppering with flaking at the girder ends (Photo 28).	28 30-32

DECK FORM OPTIONS

1. Removable Forms
2. Prestressed Concrete Form Units (See Dwg. No. 30 of 38.)
3. Permanent Corrugated Metal Forms (See details below.)

Notes:
Reinforcement shown above and on Dwg. Nos. 27 & 28 of 38 assumes use of Removable or Permanent Corrugated Metal Forms. For modified reinforcement to be used with Prestressed Concrete Form Units, see Dwg. No. 29 of 38.

See Dwg. No. 23 of 38 for girder details to be used based upon Deck Form Type chosen.

DIAPHRAGM NOTES

Where holes are indicated, connections shall be made with 7/8" diameter high-strength bolts.

Cross frames may be fabricated to fit the girders in their erected position and cambered shape, but deflected vertically due to steel dead load only.

The contractor may place diaphragms on either side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment provided there will be no inteference with other structural details.

Tapered or flat shim plates may be used in the connection between skewed diaphragms and the bearing stiffeners or stiffener connection plates. Variable thicknesses of shim plates may be used. The minimum thickness of shim plate shall be 1/8" with a maximum number of three shim plates permitted at any connection. The total thickness of all shim plates used at any connection shall not exceed 1". Shim plates shall have the dimensions of the faying surface. The shim material shall conform to ASTM Designation A36, except that on unpainted structures, the shim material shall conform to ASTM Designation A588. No additional payment will be made for furnishing and placing the shim plates.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072591 (I-481 SB/Northern Blvd)

This memorandum summarizes the seismic screening conducted for BIN 1072591 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.5% of the total deck surface area. The cores indicate the reinforcement steel is 2.25 inches to 3.0 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $613,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $855,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

FEATURE CARRIED: I-481 NB
FEATURE CROSSED: NORTHERN BLVD.

TEAM LEADER: A.THOMPSON

A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The compression seal is in good condition (Photo 1). The left end of the begin header is spalled 1.5" deep x 5' long triangular up to full width at the left (Photo 2). The right end of the begin header is similarly spalled for a 16" length and filled with debris (Photo 3). Underneath, the steel rod shaped armor material to the end of the compression seal is detached (Photo 4). Rust staining and other signs of recent leakage were noted mostly at the ends (Photo 5).	1-5
TP 349-23	End Abutment - Joint with Deck: The compression seal is in good condition. The end header is spalled +/-1" along its interface with the approach slab for +/- half of its length (Photo 6). Underneath, rust staining and other signs of recent leakage were noted (Photo 7).	6,7
TP 349-24	Begin Abutment - Bearings: The bearings are high rocker type expansion bearings. The 2012 Biennial Inspection Report rated the bearings 4 due to 5 degree max leaning in the over extended position at 60 degrees F. During this inspection the Bearing 5 rocker was the most severe and leaned 5 degrees at 30 degrees F. No rockers bear on their outer quarter. No documentation needed. (Photo 26). Otherwise, bearings are in good condition.	26
TP 349-26	Begin Abutment – Seats and Pedestals: The seat at the left is map cracked and has a full length x 1.5” deep x 3” wide spall (Photo 8). The remainder of the seats and pedestals are in good condition.	8
TP 349-27	End Abutment – Seats and Pedestals: The back 1’ of all the pedestals is hollow and rust stained due to leakage from the joint (Photo 7). The seats at the left and right ends have map cracking (Photo 9). The remainder of the seats and pedestals are in good condition.	7,9
TP 349-28	Begin Abutment – Backwall: The backwall at the top right has a 2’ wide x 6” high x 3” deep spall with no exposed rebar (Photo 10). The backwall at the left and top right has map cracking (Photo 5 and 10). Rust staining was noted throughout with more severe conditions at both ends.	5,10
TP 349-29	End Abutment – Backwall: The backwall at the left has a 4’ high x 1.5’ wide x 1” deep spall with exposed rebar (Photo 11). There is also a 1’ x 4” x 2” deep spall at the top located 2’ from the left (Photo 12). The remainder of the backwall has map cracking and hairline vertical cracking throughout (Photo 13). Rust staining was noted throughout with more severe conditions at both ends.	11-13

ITEM	REMARKS	PHOTO N0.
TP 349-30	Begin Abutment – Stem The begin stem has several hollow areas throughout (Photo 14). The sum of the hollow areas is 77.9 sf or 14.1% of the stem face. These conditions are detailed on the Abutment Deterioration Sketch.	14
TP 349-31	End Abutment – Stem There is a 25 sf hollow area under Pedestal 1 with a 0.5 sf x 1” deep spall inside of it (Photo 15). The remainder of the stem face has only isolated hairline cracking.	15
TP 350-20	Deck Elements - Curb: The left granite curb is missing for the last 4' (Photo 16). The remainder of the curbs are in good condition with some missing grout.	16
TP 350-21	Deck Elements – Sidewalks/Fascias: Sidewalks The left safety walk has light map cracking for the first 25' (Photo 17). Remainder is in good condition. The right safety walk is similarly map cracked for its entire length and has a diagonal crack at the end with (2) 3" dia. x 1/2" deep spalls along the crack (Photo 18). Fascias Both fascias have map cracking throughout (Photo 19).	17,18 19
TP 350-22	Deck Elements – Railings/Parapets: The bridge railing and posts are in good condition. Snow fencing is present over the travel lanes on both sides of the bridge. The snow fence consists of 14 steel pipe posts on the left (13 on the right) located at rail posts, steel pipe rails, and chain link fencing. On the left the bottom pipe rails at Posts 3, 4, 6 - 9, and 11 are rusted through and detached on one or both sides (Photo 20 typ.). The bottom rails at Posts 2, 5, 10, 12, and 13 are rusted but intact. On the right the bottom pipe rails at Posts 3, 4, 6 - 8, and 10 - 12 are rusted through and detached on one or both sides. The bottom rails at Posts 2, 5, and 9 are rusted but intact. The remainder of the snow fencing is in good condition.	20
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. The left lane is in good condition except for a 10' x 10' area at the begin left with light scaling. The right lane has areas of hairline cracking with hollowness (Photo 21) as detailed in the Deck Deterioration Plan. Overall, 0.6% of the deck is hollow. The underside has SIP forms and is exposed only at the overhangs (Photo 22). The SIP forms are in good condition. Both overhangs have map cracking and transverse hairline cracking throughout (Photo 23). The cracking is more concentrated at the ends (Photo 10).	10 21-23

ITEM	REMARKS	PHOTO N0.
TP 350-30	Superstructure – Paint The girders are made of weathering steel and form a protective coating. Fascia girder G1 is losing its coating in the form of small flakes on the underside of its bottom flange (Photo 24). Fascia girder G5 on the underside of its bottom flange is similar but more severe with medium sized flakes (Photo 25). The remainder of the steel surfaces has only minor peppering with minor flaking at the girder ends (Photo 22).	22,24 25

DECK FORM OPTIONS

1. Removable Forms
2. Prestressed Concrete Form Units (See Dwg. No. 30 of 38.)
3. Permanent Corrugated Metal Forms (See details, below.)

Notes:
Reinforcement shown above and on Dwg. Nos. 27 & 28 of 38 assumes use of Removable or Permanent Corrugated Metal Forms. For modified reinforcement to be used with Prestressed Concrete Form Units, see Dwg. No. 29 of 38.

DIAPHRAGM NOTES

Where holes are indicated, connections shall be made with 7/8" diameter high-strength bolts.

Cross frames may be fabricated to fit the girders in their erected position and cambered shape, but deflected vertically due to steel dead load only.

The contractor may place diaphragms on either side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment provided there will be no inteference with other structural details

Tapered or flat shim plates may be used in the connection between skewed diaphragms and the bearing stiffeners or stiffener connection plates. Variable thicknesses of shim plates may be used. The minimum thickness of shim plate shall be 1/8" with a maximum number of three shim plates permitted at any connection. The total thickness of all shim plates used at any connection shall not exceed 1". Shim plates shall have the dimensions of the faying surface. The shim material shall conform to ASTM Designation A36, except that on unpainted structures, the shim material shall conform to ASTM Designation A588. No additional payment will be made for furnishing and placing the shim plates.

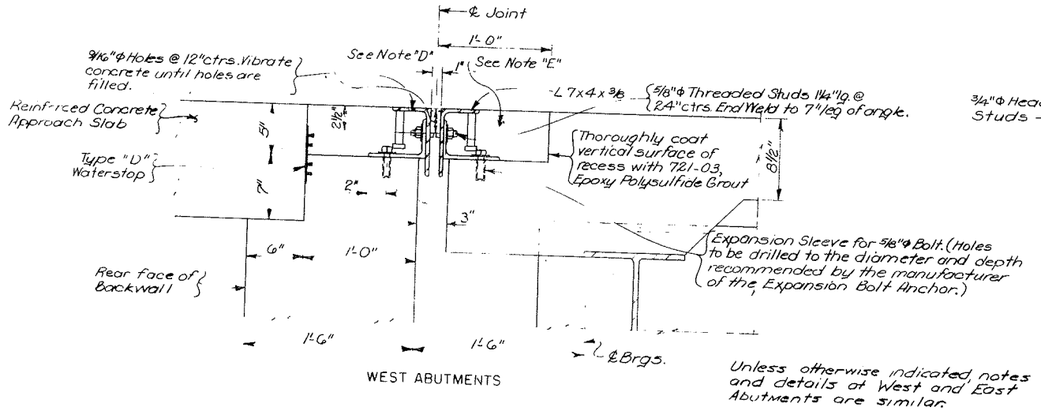
PLAN

ITEM 567.37 - ARMORED JOINT SYSTEM WITH COMPRESSION SEAL - TYPE A7 (SHOWN) - EAST ABUTMENTS

ITEM 567.31 - ARMORED JOINT SYSTEM WITH COMPRESSION SEAL - TYPE A1 (SIMILAR) - WEST ABUTMENTS

Scale: 1" = 1'-0"

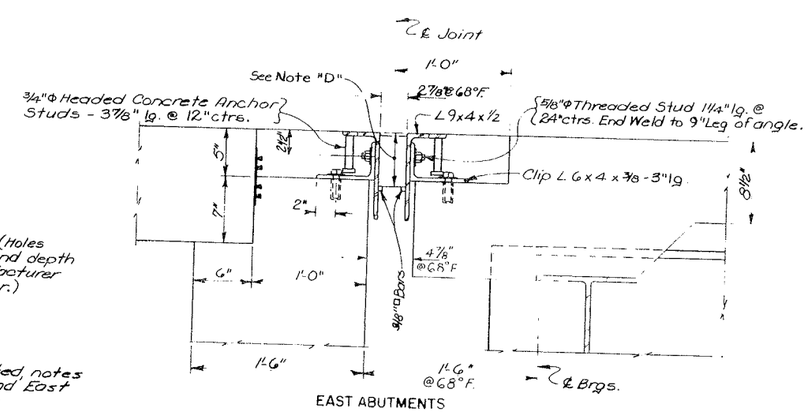


WEST ABUTMENTS

Unless otherwise indicated, notes and details at West and East Abutments are similar.

SECTION A-A

Scale: 1 1/2" = 1'-0"



EAST ABUTMENTS

Note "D"
This depth shall be indicated on the sh drawings and shall be such that when the is compressed to 50% of its normal width top of the seal shall be not less than 1/4" nor more than 3/4" below the top of roadway.

Note "E"
Concrete in recesses on superstructure provided for installing the Armored Joint System shall comply with the Specification Item 15555.04, except that mach finishing will not be required. No additional payment will be made for furnishing and pl this concrete as the quantity lies within the of the area to be paid for under Item 15555

It is desirable to have the Armored Joint its Compression Seal assembled in the sho delivered to the job site all set for installation its preformed recess in the structural slab. cases where the Armored Joint cannot be assembled in the shop, due to its excessive length causing shipping problems, the join be sealed with the Compression Seal befor structure is opened to traffic, and before discontinuing operation when work is suspend during the Winter.

The cost of furnishing and placing the Epo Polysulfide Grout shall be included in the u price bid for Item 15555.04.

For details of Headed Concrete Anchor Stud Cutting and Bending Seal, see Dwg. No. 22 of 3

For Sections B-B thru F-F, see Dwg. No. 22 of 3

For details of Clip Angle, see Dwg. No. 22 of

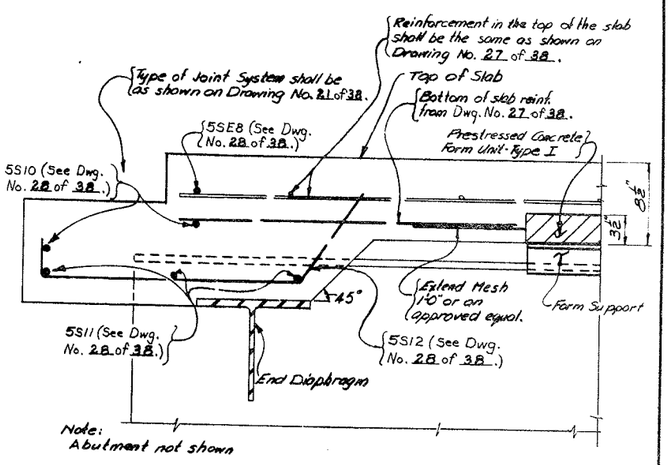
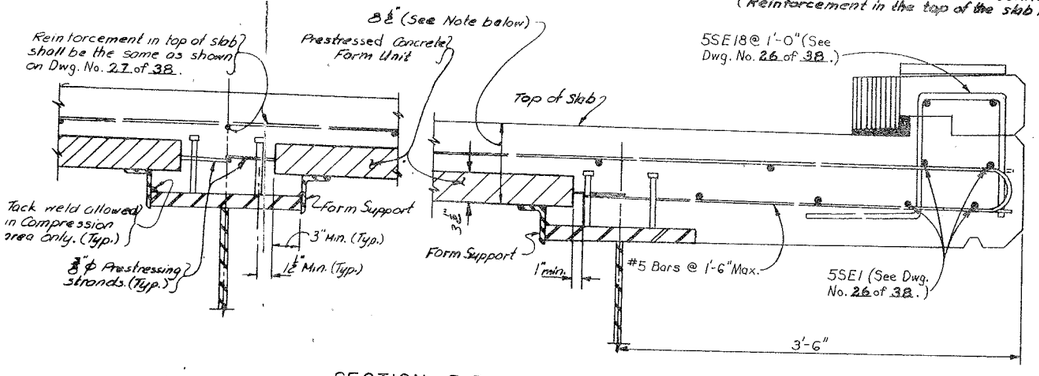
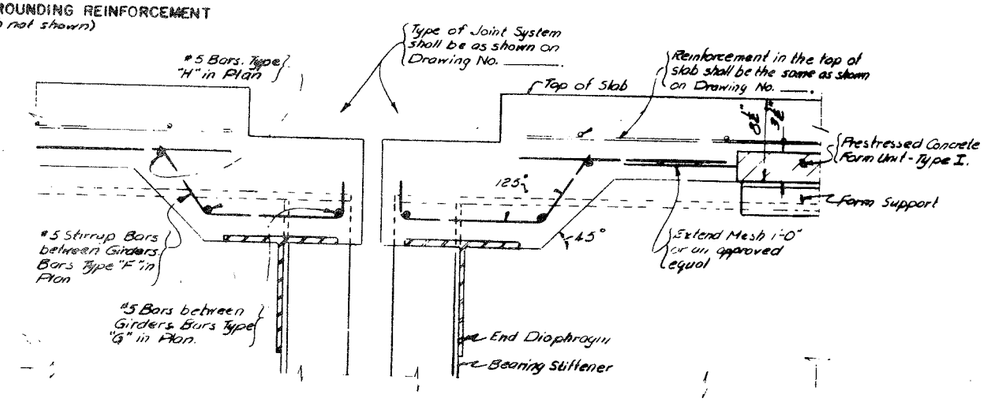
PRESTRESSED CONCRETE FORM UNITS AND SURROUNDING REINFORCEMENT
(Reinforcement in the top of the slab not shown)



SECTION A-A
SCALE: 1 1/2" = 1'-0"



SECTION B-B
SCALE: 1 1/2" = 1'-0"

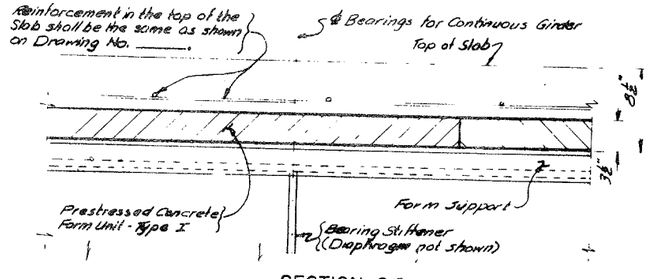


SECTION D-D
(NOT REQUIRED)

For details of Prestressed Concrete Form Units, see Dwg. No. 30 of 38.

Note:
The bottom of the Prestressed Concrete Form Unit shall be parallel to and 8½" below the finished top of the slab; except when the cross-slope of the slab changes between the Girders. In this case, the Prestressed Concrete Form Unit shall be set so the bottom is 8½" below the top of the slab at each edge of the Girder line.

NOTES:
1. No welding of form supports to the top flange in tension zones is allowed.
2. Minimum top flange width shall be 12 inches.



SECTION C-C
(NOT REQUIRED)

Details shown are for Bridge 7 (Bridge 6 similar)

Note: This drawing shows typical details, all of which may not be required on any given bridge. Likewise, the skew, beam spacing, and other details may not match those on the particular bridge.

Carried: 481I 481I33012128 Crossed: NORTHRN BLVD CR82 CheckValue: 1,792,362,220

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - No
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

No Special Emphasis Inspection Required.

General Notes To the Next Inspector:

There is a camera pole at the begin right which needs to be inspected with this bridge. BIN plate is located on top right corner of beginning stem.

Improvements Observed:

Both stems and wingwalls have been epoxy painted since last inspection and bearings have been cleaned and coated. The VC of each bridge was checked because it appears to have been repaved since last inspection. The Max VC is 15' - 9" and the Min VC is 14' - 8".

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 26, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072592 (I-481 NB/Northern Blvd)

This memorandum summarizes the seismic screening conducted for BIN 1072592 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.6% of the total deck surface area. The cores indicate the reinforcement steel is 2.5 inches to 3.0 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at two of the three sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $613,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $855,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The begin joint seal is losing its bond to the steel at the begin in the left lane for most of its length (Photo 1). No loss of bond was noted in the right lane. However, there is a 13" long section in the right lane located 3' to the right of the centerline of roadway that has come up and is torn (Photo 2). Underneath, moderate rust staining was noted throughout the backwall (Photo 3). No active leakage noted.	1-3
TP 349-23	End Abutment - Joint with Deck: The end joint seal is in fair condition and no loss of bond was noted (Photo 4). The end 14" wide header had hairline cracking at +/-2.5' spacing for its entire length. The headers sound solid. Underneath, moderate rust staining was noted throughout the backwall (Photo 5). No active leakage noted.	4,5
TP 349-26	Begin Abutment - Seats and Pedestals: The seat in Bay 4 at the front right has a 0.5 sf hollow area and a 1/16” wide crack (Photo 6). The seat at the right has a 1/16” crack with no hollowness which extends up the right face of Pedestal 5 (Photo 7). The seat in Bay 3 at the left front has a 2 sf hollow area (Photo 8). The remainder of the seats and pedestals are in good condition.	6-8
TP 349-27	End Abutment - Seats and Pedestals: The right face of Pedestal 1 is 25% hollow and has 2 vertical cracks measuring 1/16” wide (Photo 9). The remainder of the seats and pedestals are in good condition.	9
TP 349-28	Begin Abutment - Backwall: There is a 2.5 sf hollow area behind Girder 5 (Photo 10). The remainder has hairline and map cracking in all bays but is solid sounding (Photo 3).	3,10
TP 349-29	End Abutment - Backwall: The backwall has moderate rust staining and isolated vertical hairline cracking typical throughout (Photo 5).	5
TP 349-30	Begin Abutment - Stem: There is a 1 sf cracked and hollow area at the top to the left of Pedestal 5 (Photo 6). There is a 3 sf hollow area to the right and a 1 sf hollow area to the left of Pedestal 3 (Photo 8). Both areas are along the top and have horizontal cracking. The crack to the left is 1/8” wide. The remainder of the stem face has some hairline cracking and is in good condition (Photo 11).	6,8,11
TP 349-31	End Abutment - Stem: The end stem has a 2 sf hollow area under Bay 1 (Photo 12). The remainder of the stem face is in good condition with scattered hairline cracking (Photo 13).	12,13

ITEM	REMARKS	PHOTO N0.
TP 350-21	Deck Elements – Sidewalks/Fascias: The left fascia has map cracking throughout (Photo 14). The right fascia has hairline vertical cracking at +/-6' spacing throughout (Photo 15). No spalling or hollow sounding areas were found.	14,15
TP 350-22	Deck Elements - Railings/Parapets: The inside faces of the parapets have light map cracking but are solid sounding (Photo 16). The outside faces are also map cracked (Photo 14). The right parapet has staining coming from the timber noise barrier above it (Photo 15). The timber noise barrier is in good condition.	14-16
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. The deck is in good condition except for (2) adjacent areas in the right shoulder that are hollow sounding (Photo 17). The areas are 2.5 sf and 2 sf and are located near the travel lane just past midspan. Overall, 0.1% of the deck is hollow. No patches were noted. See Deck Deterioration Plan. The underside has SIP forms and is exposed only at the overhangs (Photo 18). Both overhangs have hairline cracking at +/-6' spacing throughout (Photo 19). The SIP form is missing 5' from the end for the full width of Bay 1 for a length of 4' (Photo 20). The deck and surrounding forms in this location are in good condition. The remainder of the forms are in good condition.	17-20
TP 350-30	Superstructure - Paint: The girders are made of weathering steel and form a protective coating. Left fascia Girder 1 is losing its coating in the form of medium sized sheets on the bottom flange and lower outside portion of the web (Photo 21). Right fascia Girder 5 is similar but less severe with smaller flakes. The remainder of the steel on all of the girders has only minor peppering (Photo 18).	18,21

NOTES FOR DIAPHRAGM DETAILS

1. Where holes are indicated, connections shall be 7/8" diameter high-strength bolts.
2. Cross frames may be fabricated to fit the girders in their erected position and cambered shape, but deflected vertically under the de load of the steel work only.
3. The Contractor may place diaphragms on either side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment provided there will be no inteference with other structural details
4. Snipe the outstanding leg of all angles and plates 1" minimum.
5. Tapered or flat shim plates may be used in the connection between skewed diaphragms and the bearing stiffeners or stiffener connectio plates. Variable thicknesses of shim plates may be used. The mini mum thickness of shim plate shall be 1/8" with a maximum number of shim plates permitted at any connection. The total thickness of al shim plates used at any connection shall not exceed 1". Shim plate shall have the dimensions of the faying surface. The shim material shall conform to ASTM Designation A36, except that on unpainted structures, the shim material shall conform to ASTM Designation A58 No additional payment will be made for furnishing and placing the shim plates.

Notes,
For Girder Details see Dwg. No. 29
For details of diaphragms D1, D2 and D Transverse Section on Dwg. No. 27.
For Bearing Details see Dwg. No. 3 Common Structure Details.

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

INFORMATIONAL NOTES:

BIN 1072530 - NO JOINT AT PIER.

BIN 1072791 - REPLACE COMPRESSION SEALS
BEG. ABUT. (EAST), TYPE A-5
END ABUT. (WEST), TYPE A-1

FOR JOINT DETAILS REFER TO THE FOLLOWING DRAWINGS:

GENERAL NOTES:

1. THE TEMPERATURE OF THE BRIDGE MUST BE TAKEN ON THE STRUCTURAL STEEL SURFACE TO DETERMINE THE TEMPERATURE CORRECTION FOR THE JOINT OPENINGS.
2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE E.I.C FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.

   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ⌀ ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02. GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL (MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB, IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC (INCLUDING CONSTRUCTION TRAFFIC), AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

EPOXY POLYSULFIDE GROUT NOTE:

CONTRACTOR MAY WITH THE APPROVAL OF THE ENGINEER USE MATERIAL SPECIFICATION 721-03 EPOXY POLYSULFIDE GROUT, AT THE RECESSES. INSTEAD OF THE 12 HOUR CONTINUOUS PREWETTING REQUIREMENTS (PROJECT PROPOSAL). CONTRACTOR MUST ENSURE PROPER CONSTRUCTION PRACTICES ARE FOLLOWED WHEN USING THIS GROUT. THE USE OF EPOXY POLYSULFIDE GROUT SHALL BE AT NO ADDITIONAL COST TO THE STATE.

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over Totman Road. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over Totman Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072781 Interstate Route I-481 South Bound over Totman Road

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072781 (I-481 SB / Totman Rd)

This memorandum summarizes the seismic screening conducted for BIN 1072781 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.1% of the total deck surface area. The cores indicate the reinforcement steel is 3.5 inches to 4.0 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $411,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, parapets, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $553,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The begin joint seal is losing its bond to the steel angles in some areas in the left lane (Photo 1). There is a 1' length in the left lane just left of centerline where the seal has raised up +/-1/4". The headers are in good condition. Evidence of leakage was noted underneath in the form of rust staining on the ends of the backwalls and backs of the pedestals and seats (Photo 2).	1,2
TP 349-25	End Abutment – Bearings: The end bearings are fixed and consist of a steel masonry plate and steel rocker (Photo 3). Due to spalling of the pedestal, the begin right corner of the masonry plate on Bearing 5 is undermined slightly (Photos 3 and 4). The area of undermining is less than 1 square inch, and the total design bearing area is 184 square inches. The remainder of the bearings are in good condition.	3,4
TP 349-26	Begin Abutment – Seats and Pedestals: The seat in Bay 4 has a 7” wide x 2’ long hollow area at the front adjacent to the hollow area in the stem (Photo 5). The remainder of the seats and pedestals are in good condition.	5
TP 349-27	End Abutment – Seats and Pedestals: The fascia pedestals are spalled. Pedestal 1 has a 1.5’ x 4” deep spall at its begin right corner and a 1 sf hollow area at its begin left corner (Photo 6). The seat at the left is cracked. Pedestal 5 has a 20” long x 8” deep spall at its begin right corner with exposed rebar (Photos 3 and 4). The masonry plate is undermined slightly for a total bearing area loss of less than 1 square inch. See Bearing item. The seat in Bay 1 has a 1/8” crack at the front with no hollowness (Photo 7).	3,4,6,7
TP 349-28	Begin Abutment – Backwall: The backwall has a spall at the top that extends from the middle of Bay 3 to Girder 5 (Photo 8). The spall varies in size and is 5” high x 3” deep average with no exposed rebar. The remainder of the backwall has hairline cracking with rust staining mostly at the ends (Photos 9 and 10).	8-10
TP 349-29	End Abutment – Backwall: The end backwall has scattered hairline cracking throughout (Photos 11 and 12). No evidence of significant leakage was noted.	11,12
TP 349-30	Begin Abutment – Stem: The begin stem has several hollow, cracked, and spalled areas throughout (Photos 5, 13, and 14). The sum of the hollow and spalled areas is 8.9 sf or 4.4% of the stem face. These conditions are detailed on the Begin Abutment Deterioration Sketch.	5,13,14

ITEM	REMARKS	PHOTO N0.
TP 349-31	End Abutment – Stem: The end stem is generally in good condition with no hollow or spalled areas (Photo 15).	15
TP 350-21	Deck Elements – Sidewalks/Fascias: Both fascias have map cracking throughout (Photos 16 and 17). No spalling or hollow sounding areas were found. There are no safetywalks on the structure.	16,17
TP 350-22	Deck Elements - Railings Parapets: Both parapet inside faces have light map cracking with the left parapet being slightly more pronounced (Photo 18). The outside faces are also map cracked (Photos 16 and 17). The right parapet has staining coming from the timber noise barrier above it. The timber noise barrier is in good condition.	16-18
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. The right lane is in good condition except for a 1 sf x 3/4" deep spall at the end near the right parapet where water ponds in the shoulder (Photo 19). The left lane has one delaminated area and one patched area near the end (Photo 20). See Deck Deterioration Plan. Overall, 0.3% of the deck is hollow. The underside has SIP forms and is exposed only at the overhangs (Photo 21). The left overhang has hairline cracking at +/-5' spacing (Photo 22). The right overhang is in good condition. The SIP form is missing 3' from the end for the full width of Bay 2 for a length of 2' (Photo 23). The deck and surrounding forms in this location are in good condition. The remainder of forms are in good condition.	19-23
TP 350-30	Superstructure - Paint: The girders are made of weathering steel and form a protective coating. Fascia Girder 5 is losing its coating in the form of large sheets on the outside portion of its bottom flange and lower portions of its web (Photo 24). Girder 1 is less severe with loss in the form of small flakes (Photo 25). Both fascia girders have small flaking on their bottom faces (Photo 26). The remainder of the steel on all of the girders has only minor peppering.	24-26

NOTES FOR DIAPHRAGM DETAILS

1. Where holes are indicated, connections shall be 7/8" diameter high-strength bolts.
2. Cross frames may be fabricated to fit the girders in their erected position and cambered shape, but deflected vertically under the de load of the steel work only.
3. The Contractor may place diaphragms on either side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment provided there will be no inteference with other structural details
4. Snipe the outstanding leg of all angles and plates 1" minimum.
5. Tapered or flat shim plates may be used in the connection between skewed diaphragms and the bearing stiffeners or stiffener connectio plates. Variable thicknesses of shim plates may be used. The mini mum thickness of shim plate shall be 1/8" with a maximum number of shim plates permitted at any connection. The total thickness of al shim plates used at any connection shall not exceed 1". Shim plate shall have the dimensions of the faying surface. The shim material shall conform to ASTM Designation A36, except that on unpainted structures, the shim material shall conform to ASTM Designation A58 No additional payment will be made for furnishing and placing the shim plates.

Notes,
For Girder Details see Dwg. No. 29
For details of diaphragms D1, D2 and D Transverse Section on Dwg. No. 27.
For Bearing Details see Dwg. No. 3 Common Structure Details.

GENERAL NOTES:

1. THE TEMPERATURE OF THE BRIDGE MUST BE TAKEN ON THE STRUCTURAL STEEL SURFACE TO DETERMINE THE TEMPERATURE CORRECTION FOR THE JOINT OPENINGS.
2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE E.I.C FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.

   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ⌀ ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02. GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL (MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB, IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC (INCLUDING CONSTRUCTION TRAFFIC), AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

EPOXY POLYSULFIDE GROUT NOTE:

CONTRACTOR MAY WITH THE APPROVAL OF THE ENGINEER USE MATERIAL SPECIFICATION 721-03 EPOXY POLYSULFIDE GROUT, AT THE RECESSES. INSTEAD OF THE 12 HOUR CONTINUOUS PREWETTING REQUIREMENTS (PROJECT PROPOSAL). CONTRACTOR MUST ENSURE PROPER CONSTRUCTION PRACTICES ARE FOLLOWED WHEN USING THIS GROUT. THE USE OF EPOXY POLYSULFIDE GROUT SHALL BE AT NO ADDITIONAL COST TO THE STATE.

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over Totman Road. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over Totman Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072782 Interstate Route I-481 North Bound over Totman Road

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072782 (I-481 NB/Totman Rd)

This memorandum summarizes the seismic screening conducted for BIN 1072782 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.3% of the total deck surface area. The cores indicate the reinforcement steel is 2.0 inches to 2.75 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at two of the three sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $407,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, parapets, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $547,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
TP 349-26	Begin Abutment - Seats and Pedestals: Pedestal 5 has a full height hairline crack on its right face but sounds solid. The remainder of the pedestals are in good condition.	1
TP 349-28	Begin Abutment - Backwall: The backwall at the right has a 5" dia. x 1.5" deep spall at the top 1.5' from the right with 4 sf of map cracking surrounding it and a 6" wide x 3" high x 1/2" deep spall behind Girder 5 (Photo 2). There are full height hairline cracks located behind Girder 4, in Bay 2, and behind Girder 2 (Photo 3). Remainder is in good condition.	2,3
TP 349-29	End Abutment - Backwall: The backwall at the left has hairline vertical and horizontal cracks near the top measuring 1.5' long with 1 sf of map cracking with rust staining (Photo 4). Full height hairline cracking was noted behind Girder 2 and in Bay 2 (Photo 6). The backwall at the right has full height map cracking with efflorescence for the right 2' (Photo 5). No spalling or hollowness noted. Remainder is in good condition.	4-6
TP 349-30	Begin Abutment - Stem: The begin stem has a 36 sf hollow area at the right and a 6 sf hollow area at the left. The remainder of the stem has some vertical hairline cracking but is in good condition.	7
TP 349-31	End Abutment - Stem: The end stem has a 6 sf hollow area at the top left and a 10" x 3" hollow area at the top right. The remainder of the stem is in good condition.	8
TP 350-21	Deck Elements – Sidewalks/Fascias: Both fascias have map cracking throughout with no spalling or hollow sounding areas. The bridge has no sidewalks.	9
TP 350-22	Deck Elements - Railings/Parapets: The inside and outside faces of the parapets have light map cracking but are solid sounding (Photos 9 and 10).	9,10

ITEM	REMARKS	PHOTO N0.
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. The left lane is in good condition except for 2 hollow areas near midspan (Photo 12). The right lane has several areas of hollowness (Photos 11 and 13). There are also several patches that are in good condition (Photo 13). Conditions are documented in the attached Deck Deterioration Plan. The underside has SIP forms and is exposed only at the overhangs (Photo 16). The deck at the right overhang at the begin backwall has an 8" dia. x 1" deep spall with rust staining (Photo 2). The left and right overhangs have 3” deep corner spalling with exposed rebar at the end backwall. The left spalling is 1’ wide and the right spalling is 2.5’ wide with a 2’ length of debonded rebar (Photos 4 and 5). The remainder of both overhangs have hairline cracking at +/-3’ spacing (Photo 15). The SIP form is missing 5’ from the end for the full width of Bay 1 for a length of 4’ (Photo 14). The deck and surrounding forms in this location are in good condition. Remainder of forms in good condition.	2,4,5 11-16
TP 350-30	Superstructure - Paint: The protective coating is coming off in large sheets on the fascia girder bottom flanges and lower portions of the web (Photos 15 and 17). The left fascia girder is worse with the lower half of the web affected. The remainder of the fascia and interior girders has only light peppering and is in good condition (Photo 16).	15-17

DIAPHRAGM NOTES

4. Where holes are indicated, connections shall be made with 7/8" diameter high-strength bolts.
2. Cross frames may be fabricated to fit the girders in their erected position and cambered shape, but deflected vertically due to steel dead load only.
3. The Contractor may place diaphragms on either side of the bearing stiffeners or stiffener connection plates as necessary to correct alignment provided there will be no interference with other structural details.
4. Tapered or flat shim plates may be used in the connection between skewed diaphragms and the bearing stiffeners or stiffener connection plates. Variable thicknesses of shim plates may be used. The minimum thickness of shim plate shall be 1/8" with a maximum number of three shim plates permitted at any connection. The total thickness of all shim plates used at any connection shall not exceed 1". Shim plates shall have the dimensions of the faying surface. The shim material shall conform to ASTM Designation A36, except that on unpainted structures, the shim material shall conform to ASTM Designation A588. No additional payment will be made for furnishing and placing the shim plates.

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

INFORMATIONAL NOTES:

BIN 1072530 - NO JOINT AT PIER.

BIN 1072791 - REPLACE COMPRESSION SEALS
BEG. ABUT. (EAST), TYPE A-5
END ABUT. (WEST), TYPE A-1

FOR JOINT DETAILS REFER TO THE FOLLOWING DRAWINGS:

DWG. NO. JD-1 - MODIFIED ARMORED COMPRESSION SEAL JOINT SYSTEM.

BRIDGE REHABILITATION PROJECT (ELEMENT SPECIFIC)
VARIOUS BRIDGES ON INTERSTATE 481
TOWNS OF DEWITT AND CICERO
ONONDAGA COUNTY
P.I.N. 305613 B.I.N. ALL BIN'S

GENERAL NOTES:

1. THE TEMPERATURE OF THE BRIDGE MUST BE TAKEN ON THE STRUCTURAL STEEL SURFACE TO DETERMINE THE TEMPERATURE CORRECTION FOR THE JOINT OPENINGS.
2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M. AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE E.I.C FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.
   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ø ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02. GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL (MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB. IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC INCLUDING CONSTRUCTION TRAFFIC, AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

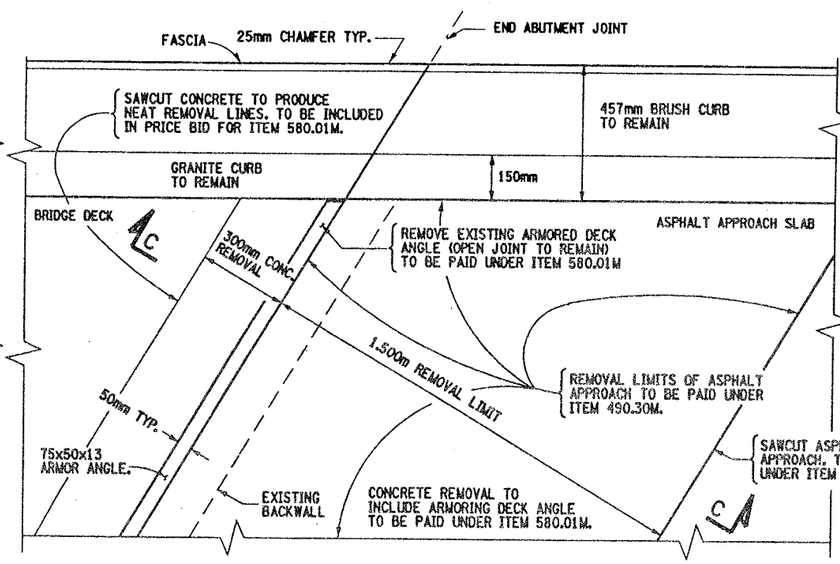
EXISTING BEG. ABUTMENT JOINT PLAN VIEW

BIN 1093550 - SOUTH ABUT.



EXISTING END ABUTMENT JOINT PLAN VIEW

BIN 1093550 - NORTH ABUT.

NOTES:

1. REMOVAL OF ARMORING DECK ANGLE SHALL BE FROM CURB TO CURB.
2. FOR SECTION VIEWS SEE DWG. NO. JD-49.
3. BOTH ABUTMENTS HAVE 51°-00'-00" SKEW. ORIGINAL CONTRACT NUMBER FISH 70-7.
4. END ABUTMENT A PORTION OF THE ARMORING DECK ANGLE HAS BEEN REMOVED BY STATE MAINT. FORCES. WHERE THE DECK ANGLE HAS BEEN REMOVED ELASTOMERIC CONCRETE HAS BEEN PLACED IN THE HEADER, THIS MAY INCREASE THE REMOVAL DIFFICULTY. REMOVAL COSTS TO BE INCLUDED IN THE PRICE BID FOR ITEM 580.01M.
5. LEFT SIDE OF DECK SHOWN, RIGHT SIDE IDENTICAL.
6. SAW CUTTING OF CONCRETE SHALL BE INCLUDED IN PRICE BID FOR ITEM 580.01M.
7. REFER TO DWG. NO. JT-3, FOR ADDITIONAL DETAILS.

WORK TO BE DONE:

BEGINNING ABUTMENT (SOUTH ABUT.) - REMOVE ARMORING DECK ANGLE, REPAIR THE CONCRETE WHERE THE ANGLE WAS REMOVED AND REPAIR ASPHALT APPROACH (OPEN JOINT TO REMAIN). ALSO CLEAN THE EXISTING DRAINAGE SYSTEM, SEE CLEAN DRAINAGE SYSTEM NOTE & DETAILS ON DWG. NO. JD-49.

END ABUTMENT (NORTH ABUT.) - REMOVE ARMORING DECK ANGLE, REPAIR THE CONCRETE WHERE THE ANGLE WAS REMOVED AND REPAIR ASPHALT APPROACH.

ITEMS USED:

ITEM 490.30M	- MISC. COLD MILLING OF BIT. CONC. (SM)
ITEM 08520.5014M	- SAWCUTTING BIT. CONC. (M)
ITEM 555.09M	- STRUCT. CONCRETE, CLASS "HP" (CM)
ITEM 556.0202M	- EPOXY-COATED BAR REINFORCEMENT FOR STRUCT. (Kg)
ITEM 580.01M	- REMOVAL OF STRUCT. CONCRETE (CM)

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 south bound bridge over Thompson Road. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 south bound bridge over Thompson Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072791 Interstate Route I-481 South Bound over Thompson Road

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072791 (I-481 SB / Thompson Rd)

This memorandum summarizes the seismic screening conducted for BIN 1072791 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 3.1% of the total deck surface area. The cores indicate the reinforcement steel is 3.0 inches to 6.5 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $385,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, parapets, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $514,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

STRUCTURE IDENTIFICATION

a. Bridge Identification Number (BIN): 1072792
b. Reference Marker: 481I 3301 2136
c. Region: NYSDOT Region 3
d. County: Onondaga
e. Town: Cicero
f. Feature Carried: I-481 Northbound
g. Feature Crossed: Thompson Rd.

INTRODUCTION

a. Bridge History
   i. Year Built: 1986
   ii. Bridge Type: Single Span Steel, Multi-girder
   iii. Span Length: 101 feet
   iv. Out-to-Out Width: 44 feet
   v. Structural Ratings and Rankings
      1. Federal Sufficiency: 90.3 (June 2012)
      2. Condition Rating: 5.683 (June 2012)
      3. General Recommendation: 6
   vi. Live Load Posting (HS25): No
   vii. National Highway System (NHS): Yes
   viii. Previous work Done: Waterproof bridge deck (1999), Joints replaced and bearing restoration (2002).
   ix. Planned Future Work: N/A
b. Highway Classification
   i. Functional Classification: Urban Principle Arterial - Interstate
   ii. Traffic Volumes

YEAR	AADT Projected
2014	36758
2034	54620
2054	81163

   iii. Plan for Maintenance and Protection of Traffic:
   Maintenance and Protection of traffic will be achieved by staged construction.

ITEM	REMARKS	PHOTO N0.
TP 349-26	Begin Abutment - Seats and Pedestals: The left face of Pedestal 1 is cracked but sounds solid (Photo 1). The remainder of the seats and pedestals are in good condition.	1
TP 349-27	End Abutment - Seats and Pedestals: The right and left faces of Pedestal 1 are cracked but sound solid (Photos 2 and 3). The remainder of the pedestals are in good condition. The 1 sf area of bridge seat to the left of Pedestal 1 is cracked with the left corner hollow sounding. The seat in Bay 1 has a 4' long transverse crack located 5" from the front with a 2.5' x 4" adjacent hollow area extending from the stem (Photo 3). The seat area to the right of Pedestal 5 has hairline cracking over 50% of its area (Photo 4).	2-4
TP 349-28	Begin Abutment - Backwall: The begin backwall has hairline horizontal and map cracking in all bays (Photos 5 and 6). No hollow areas were found.	5,6
TP 349-29	End Abutment - Backwall: The backwall at the right has a 1/16" wide full height crack with rust staining (Photo 7). The remainder of the backwall has map cracking throughout. No spalling or hollowness noted.	7
TP 349-30	Begin Abutment - Stem: The begin stem has a 3 sf hollow area at the top under fascia Pedestal 5 and a 1 sf hollow area near the bottom right (Photo 8). The remainder is in good condition (Photo 9).	8,9
TP 349-31	End Abutment - Stem: The end stem has an 8 sf hollow area at the top under Pedestal 1 (Photo 11) and a 3 sf cracked and hollow area at the top under fascia Pedestal 5 (Photo 10). There is also a 1 sf hollow area at the bottom near the left. The remainder is in good condition (Photo 11).	10,11
TP 350-21	Deck Elements – Sidewalks/Fascias: The right fascia has full height map cracking throughout its length with no spalling or hollow sounding areas (Photo 12). The left fascia is better with vertical hairline cracking spaced at +/-6' (Photo 13).	12,13
TP 350-22	Deck Elements - Railings/Parapets: Both parapet inside faces are map cracked for their entire length with the heaviest concentration at the begin left (Photo 14). The right parapet outside face has light map cracking (Photo 12). The left parapet outside face has heavy map cracking and staining coming from the timber noise barrier above it (Photo 13). The left timber noise barrier is in good condition.	12-14

FEATURE CARRIED: I-481 NB
FEATURE CROSSED: THOMPSON RD

TEAM LEADER: A.THOMPSON
A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 350-27	Superstructure - Structural Deck: The structural deck is an 8.5" thick concrete mono deck with SIP forms. The right lane is in good condition except for a 6' long x 10' wide area with light scaling located +/-37' from the begin (Photos 15 and 16). This area sounds solid. The left lane has areas of hollowness (Photo 17). There are also several patched areas. These conditions are detailed in the Deck Deterioration Plan. There is one patch located +/- 20' from the end centered in the left lane which measures 6" wide x 14' long (Photo 18). There are (2) 1.5' long by 6" wide areas in the patch that have settled 1/2". The underside is exposed only at the overhangs (Photos 23 and 24). The deck at the left overhang near Girder 1 at the begin backwall has a 7" x 4" x 1” deep spall with rust staining (Photo 19). There is a similar but less severe spall at the right overhang. The deck at the right overhang near Girder 5 at the end backwall has (3) 3” dia. x 1” deep spalls with hairline cracking with efflorescence (Photo 20). Both deck overhangs have transverse hairline cracking at +/-3’ spacing for most of the span length (Photo 21). The SIP form is missing in Bay 4 for a 4’ length 5’ from the end (Photo 22). The deck and surrounding forms in this location are in good condition. Remainder of forms are in good condition.	15-24
TP 350-30	Superstructure - Paint: The protective coating is coming off in large flakes on the fascia girder bottom flanges and lower 3” of the web. The remainder of the fascia and interior girders has only light peppering and is in good condition (Photo 24).	24

LEGEND

EXISTING JOINT TYPE:

ACJ = ARMORED COMPRESSION JOINT SYSTEM
MOD = MODULAR JOINT SYSTEM
MAC = MODIFIED ARMORED COMPRESSION SYSTEM (NO HORIZ. ARMORING ANGLE)
ADA = ARMORED DECK ANGLE
SS = STRIP SEAL JOINT
OPEN = OPEN JOINT

PROPOSED JOINT TYPE:

MAC-1 = MOD. ARM./COMP. SEAL JT. SYS. (A-1)
MAC-2 = MOD. ARM./COMP. SEAL JT. SYS. (A-2)
MAC-5 = MOD. ARM./COMP. SEAL JT. SYS. (A-5)
MAC-6 = MOD. ARM./COMP. SEAL JT. SYS. (A-6)
RCS = REPLACE EXISTING COMPRESSION SEAL
RADA = REMOVE ARMOR DECK ANGLE
MOD-1 = MODULAR JT. SYS. (ONE-CELL)
MOD-2 = MODULAR JT. SYS. (TWO-CELL)

JOINT BEND LOCATION:

N = NO BENDS
CRB = CURB LINE
PAV'T = PAVEMENT

GENERAL NOTES:

- ALL MEASUREMENTS SHALL BE FIELD VERIFIED.
- CURB TO CURB LENGTHS ARE MEASURED ALONG ℄ OF JOINT.
- MULTIPLE DIMENSIONS ARE SHOWN LOOKING UP-STATION, LEFT TO RIGHT.
- ALL DIMENSIONS ARE SHOWN IN METERS.

INFORMATIONAL NOTES:

BIN 1072530 - NO JOINT AT PIER.

BIN 1072791 - REPLACE COMPRESSION SEALS
BEG. ABUT. (EAST), TYPE A-5
END ABUT. (WEST), TYPE A-1

FOR JOINT DETAILS REFER TO THE FOLLOWING DRAWINGS:

DWG. NO. JD-1 - MODIFIED ARMORED COMPRESSION SEAL JOINT SYSTEM.

EPOXY POLYSULFIDE GROUT NOTE:

CONTRACTOR MAY WITH THE APPROVAL OF THE ENGINEER USE MATERIAL SPECIFICATION 721-03 EPOXY POLYSULFIDE GROUT, AT THE RECESSES. INSTEAD OF THE 12 HOUR CONTINUOUS PREWETTING REQUIREMENTS (PROJECT PROPOSAL). CONTRACTOR MUST ENSURE PROPER CONSTRUCTION PRACTICES ARE FOLLOWED WHEN USING THIS GROUT. THE USE OF EPOXY POLYSULFIDE GROUT SHALL BE AT NO ADDITIONAL COST TO THE STATE.

SEALS (mm)			ARMORED JOINT SYSTEM	
TYPE	NOMINAL WIDTH	DIM. "A" @ 20°C.	TYPE	END CONDITION
1	44	25	A1	Fixed End Only
2	51	30	A2	Exp. up to 18 m
3	64	38	A3	Exp. over 18 m to 23 m
4	76	44	A4	Exp. over 23 m to 27 m
5	89	52	A5	Exp. over 27 m to 38 m
6	102	60	A6	Exp. over 38 m to 46 m

Maximum Skew Limits: Fixed End - No Limit
Exp. End - 45° A2 thru A6

GENERAL NOTES:

1. THE TEMPERATURE OF THE BRIDGE MUST BE TAKEN ON THE STRUCTURAL STEEL SURFACE TO DETERMINE THE TEMPERATURE CORRECTION FOR THE JOINT OPENINGS.
2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE E.I.C. FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.

   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ⌀ ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02, GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB. IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC (INCLUDING CONSTRUCTION TRAFFIC, AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 north bound bridge over Thompson Road. Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 north bound bridge over Thompson Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1072792 Interstate Route I-481 North Bound over Thompson Road

Based on laboratory analyses of bulk samples collected, no asbestos-containing materials were identified.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1072792 (I-481 NB/Thompson Rd)

This memorandum summarizes the seismic screening conducted for BIN 1072792 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 1.6% of the total deck surface area. The cores indicate the reinforcement steel is 2.25 inches to 2.75 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all of the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 3 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge parapets and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $393,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, parapits, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $527,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

INTRODUCTION

a. Bridge History
   i. Year Built: 1972
   ii. Bridge Type: Single Span, Steel Multi-girder
   iii. Span Length: 123 feet
   iv. Out-to-Out Width: 42 feet
   v. Structural Ratings and Rankings
      1. Federal Sufficiency: 98 (Apr. 2011)
      2. Condition Rating: 5.359 (Apr. 2013)
      3. General Recommendation: 6 (Apr. 2013)
   vi. Live Load Posting (HS25): No
   vii. National Highway System (NHS): Yes
   viii. Previous work Done:

1987 – Replace wearing surface (asphalt concrete overlay) with concrete overlay
1998 – Clean and paint metal surfaces
2001 – Asbestos testing.
2003 – Asbestos testing.
2004 – Replace begin joint seal; remove end armor angle; Misc.repair of concrete at abutments.

   ix. Planned Future Work: N/A

b. Highway Classification

i. Functional Classification: Urban Principle Arterial - Interstate

ii. Traffic Volumes

Note: This bridge is not open to general public traffic.

YEAR	AADT
2014	NA
2034	NA
2054	NA

iii. Plan for Maintenance and Protection of Traffic:
Maintenance and protection of traffic will be achieved by staged construction.

FEATURE CROSSED: I-481 SB **ASSIST. TEAM LEADER: T. OLMSTEAD**

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck:	
	Begin - The begin bearings are expansion. The begin joint is steel armor angle with a compression seal. From above, the compression seal is in good condition (Photo 1). The steel armor angles are rusted with some delamination of the steel angles evident. The armor angle at the leading edge of the header has scrapes from plow impacts but no major deformations. The concrete between the leading angle and the joint armor angle is deteriorated and spalled 1 inch deep and the top leg of the leading angle is undermined in the right and left lanes (Photo 2).	1,2
TP 349-24	Begin Abutment – Bearings:	3,4,5
	The begin bearing are expansion. The left fascia bearing is rusted and extended at -1 ºF indicating it may not be functioning properly (Photos 3 & 4). The interior bearings are in better condition and are in their normally contracted position at -1 ºF (Photo 5).	
TP 349-26	Begin Abutment - Seat and Pedestals:	
	Seat - The seat has several cracks and a hollow area as Illustrated on the Begin Abutment Deterioration Sketch. Significant areas are noted below:	
	• Bay1 is cracked along the left side about 4 inches in from the front face (Photo 6);	6
	• Bay 2 has a full length crack at the middle of the bay (Photo 7).	7
	• Bay 2 has a 3 square foot hollow area at the right front face (Photo 8).	8
	Pedestals - The pedestals are in good condition with no significant cracks or hollow areas detected.	
TP 349-28	Begin Abutment – Backwall:	9,10
	There is tight mapcracking of approximately 50% of surface of the backwall, particularly at the left side (Photo 9). There is a 1 foot wide x 6 inches high x up to 6 inches deep spall at the top left backwall. At the right side of bay 2, there is a full height vertical crack (Photo 10). See the Begin Abutment Deterioration Sketch.	
TP 349-30	Begin Abutment – Stem:	11,12
	The stem has scattered cracks as illustrated on the Begin Abutment Deterioration Sketch. There is a horizontal crack one foot below the top at the left side of bay 1 (Photo 11). There is a full height vertical crack at the middle of bay 2 (Photo 12).	
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck:	13
	The end bearings are fixed. The steel armor was removed in 2004. There is no joint visible from the top (Photo 13).	
TP 349-25	End Abutment – Bearings:	14,15
	The end bearings are fixed. The left fascia bearing is rusted (Photo 14). The interior bearings are in better condition. The left anchor bolt at bearing B5 is sheared off (Photo 15).	

ITEM	REMARKS	PHOTO NO.
TP 349-27	End Abutment - Seats and Pedestals: Seat - The seat has tight mapcracking with efflorescence over 30% of the surface in pedestal bays 2 and 4. The front edge of the seat is cracked 3 feet long with staining in pedestal bay 3 (Photo 16). The remainder is in good condition with no hollow areas or significant cracks detected.	16
	Pedestals - The sides of pedestal P1 are mapcracked (Photos 17 & 18). The front face of pedestal P5 is light mapcracked over 20% of the surface. See the End Abutment Deterioration Sketch. The remaining pedestals are in good condition with no significant cracks or hollow areas detected.	17,18
TP 349-29	End Abutment – Backwall: The backwall is tight hairline cracked throughout. There is leakage down the end left backwall resulting in cracking with efflorescence; and spalling of the backwall (Photo 19). At the top, there is a 1 foot wide x 2 feet high x up to 3 inches deep spall; and there is a full height crack at the left side with efflorescence and spalling along the crack. Above pedestal P1, there is a 0.5 foot high x 1 foot wide surface spall (Photo 17); and at the right side of Pedestal 1, there is a 1 foot high x 1 foot wide x 1 inch deep spall (Photo 20). See the End Abutment Deterioration Sketch.	17,19,20
TP 349-31	End Abutment – Stem: The stem is tight hairline cracked over approximately 80% of the surface (Photo 21). The left 1/3 is the worst area with more pronounced cracks, surface scaling, staining and efflorescence (Photos 22 & 23). There are more prounced cracks scattered throughout. See the End Abutment Deterioration Sketch.	21,22,23
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: The end left approach pavement at the curbline is slightly higher than the top of deck trapping runoff and causing shallow ponding along the curbline of the deck at that location (Photo 24).	24
TP 349-55	Approach - Settlement: There is 0.5 inch of settlement at the begin approach (Photo 1). At the end approach, there is no significant settlement (Photo 13).	1,13
TP 349-57	Approach - Pavement: At the end approach, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with a gap up to 3 inches wide and 1.5 inches deep (Photo 13). The gap at the end pavement joint allows runoff to seep into the pavement and abutment backfill. There is leakage evident down the end left backwall resulting in cracking and spalling of the backwall (Photo 19).	13,19
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth.	

ITEM	REMARKS	PHOTO NO.
TP 350-20	Deck - Curbs: The curbs are granite in good condition. The average curb reveal is 8.5 inches.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – The safety walks have tight map cracking on less than 5% of the top surface (Photo 25). No hollow sounding areas or spalls were detected.	25
	Fascias – Left - The upper (safety walk) portion of the left fascia are tight mapcracked over approximately 5% of the surface concentrated below the railing posts (Photo 26). The lower fascia portion has scattered vertical hairline cracks (Photo 27).	26,27
	Right - The right fascia is generally in good condition. At the end, there is a vertical crack with efflorescence through the lower portion that wraps under the fascia into the deck fascia bay (Photo 28).	28
TP 350-22	Deck - Railings: The railings are in good condition with only oxidation of the galvanized surfaces. There are no snow fences.	
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono-deck. SIP forms were not used. Records indicate the deck was repaired, the surface was scarified and it received a 1.75 inch concrete overlay in 1987.	
	Top of Deck - There is scattered random cracking with hollow areas throughout (Photos 29, 30, & 31) as illustrated in the Top of Deck Deterioration Sketch. The total hollow area is 2.2% of the surface.	29,30,31
	Underdeck – There is widespread hairline cracking of the underside of the deck throughout (Photo 32). There are scattered more pronounced cracks, some with efflorescence. There are delaminated, hollow sounding, and damp areas; and spalls, some with exposed rusted reinforcing bars. The deteriorated areas are illustrated on the Under Deck Deterioration Sketch. The total damaged area of the underside of the deck is 1.3% of the area. The more significant areas are noted below:	32
	○ Bay 2 in diaphragm bay 3 – 6 square foot area of hollow sounding concrete.	
	○ Bay 2 near the end of diaphragm bay 4 – 20 square foot area of hollow sounding delaminated concrete and a 4 feet wide x 6 inches long x 1.5 inches deep spall with 2 exposed reinforcement bars (Photo 33).	33
	○ Bay 2 in diaphragm bay 5 – 22 square foot area of cracking and hollow sounding concrete (Photo 34).	34
	○ Bay 3 near diaphragm 5 – 12 square foot area of hollow sounding concrete and a spalled area along the begin edge (Photo 35).	35
	○ Bay 3 near the end right – 15 square foot area of surface scaling with light efflorescence (Photo 36).	36
	○ Right fascia bay at the end right – crack with efflorescence (Photo 28).	28

ITEM	REMARKS	PHOTO NO.
TP 350-28	Primary Members: There is localized corrosion at the end left side of girder G1 (Photo 37). Web section loss is estimated at less than 5% in a narrow 2 inches high x 6 inches long band ahead of the bearing stiffener. The remainder of the primary members are in good condition with surface rusting where the paint has peeled or blistered. There is no other significant section loss noted.	37
TP 350-29	Secondary Members: Good condition; surface rusting where the paint has peeled or blistered. There is no significant section loss noted.	
TP 350-30	Paint: The paint system is failed on 10% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges and scattered locations on the girder webs (Photo 38). The outside and inside surfaces of the left fascia girder (Photos 39 & 40) and the inside surface of the right fascia girder (Photo 41) are the worst with blistering and peeling paint over 10% of the surfaces of the webs and 20% of the bottom flanges. There is surface rusting where the paint has peeled or blistered.	38,39,40 41
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None.	
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · Diaphragm gusset plate welded connections to bottom flanges of all girders.

NOTES:
1. For General Notes see Sheet No. 124
2. For design purposes the foundation pressure does not exceed 2 1/2 tons/s.f.
Three (3) months waiting period required after completion of backfilling behind abutments and prior to setting final pedestal elevations. Duration of required waiting period may be reduced by the Deputy Chief Engineer (Design) based upon analysis of settlement platform readings. Readings at one (1) week intervals to be taken at the settlement platforms in the vicinity of the abutments will be required after the completion of backfill operation.
3. For curve data see Alignment Plan, Sheet No. 40
4. The structural slab on this structure shall be formed with removable forms.
5. For end of bridge details see sheet No. 127

WORK TO BE DONE ON BIN 1093510:

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION.
2. REPLACE EXISTING COMPRESSION SEAL AT BEG. ABUTMENT (WEST). EXISTING JOINT & ARMORING DECK ANGLE TO REMAIN.
3. REMOVE EXISTING ARMORED DECK ANGLE AT END ABUTMENT (EAST).
4. REPAIR DECK AREA AT END ABUTMENT (EAST), WHERE ARMORING DECK ANGLE WAS REMOVED.
5. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES (SEE JD-45).
6. PERFORM MISCELLANEOUS REPAIRS TO CONCRETE ELEMENTS AT ABUTMENT.

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1093510
NYSDOT Maintenance Ramp
over Interstate Route I-481 South Bound

Prepared for:

New York State
Department of Transportation

PIN 3056.13.111

LaBella Project No. 201001

August 2001

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the NYSDOT Maintenance Road Bridge over Interstate Route I-481. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1093510 – NYSDOT Maintenance Road over Interstate Route I-481

Type of Material	Estimated Amount
Sheet Packing	10.6 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the NYSDOT Maintenance Road Bridge over Interstate Route I-481. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1093510 – NYSDOT Maintenance Road over Interstate Route I-481

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 10.6 square meters. This estimate is based on field measurements taken at the time of the site visit. The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: APRIL 3, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093510 (I-690 EB / I-481 SB)

This memorandum summarizes the seismic screening conducted for BIN 1093510 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 2.2% of the top and 1.5% of the underside of the deck area. The cores indicate the reinforcement steel is 4.5 inches to 5.0 inches below the surface of the deck. The lab test indicate that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Damaged areas at the underside of the deck will require full depth reconstruction. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. Reinforcement with significant section loss will be replaced. Partial and full depth removal areas will be reconstructed to adjacent grade. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2.25 inches of the existing deck will remove a portion of the deck with the high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $505,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $590,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

FEATURE CROSSED: I-481 SB **ASSIST. TEAM LEADER: T. OLMSTEAD**

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are fixed. The steel armor joint was removed in 2004 and there is no joint visible from the top (Photo 1). The concrete transition header is cracked at one foot intervals over most its length (Photo 2). Under the deck, the pad at the top of the backwall has "walked" and hanging down in bays 1 & 2 (Photo 3).	1,2,3
TP 349-24	Begin Abutment – Bearings: The begin bearings are fixed. The fascia bearings are rusted and movement is likely restricted (Photo 4). The interior bearings are in better condition. The left anchor bolt at bearing B5 sets up above the masonry plate by ¼ inch, is dull sounding when struck with a hammer, and is likely sheared off (Photo 5).	4,5
TP 349-26	Begin Abutment - Seat and Pedestals: Seat - The front edge of the seat is cracked 3 feet long with staining in pedestal bay 4 (Photo 6). The remainder is in good condition with no hollow areas or significant cracks detected.	6
	Pedestals - The right side of pedestal P1 is mapcracked with efflorescence (Photo 7). The lower front left corner of pedestal P4 is cracked and hollow sounding (Photo 8). The lower right corner is similar. The remaining pedestals are in good condition with no significant cracks or hollow areas detected.	7,8
TP 349-28	Begin Abutment – Backwall: There is tight mapcracking with light efflorescence throughout the backwall (Photo 9). There is leakage down the backwall at the left (Photo 10) and there is a 1 foot wide x 10 inches high x up to 6 inches deep spall at the top left backwall (Photo 11). In bay 2, there is light surface scaling with efflorescence (Photo 12). At the center of bay 3, there is a full height vertical hairline crack (Photo 13). See the Begin Abutment Deterioration Sketch.	9,10,11 12,13
TP 349-30	Begin Abutment – Stem: The stem is tight hairline cracked over approximately 80% of the surface (Photo 14). The left side is the worst area with surface scaling, staining and efflorescence (Photo 15). Also, the stem below pedestal bay 4 is mapcracked and stained (Photo 16). There are more pronounced hairline cracks scattered over the surface. See the Begin Abutment Deterioration Sketch.	14,15,16
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end joint has armorless concrete headers with a filled elastic material seal. The concrete headers are in poor condition (Photo 17). Both headers are cracked at one foot intervals and the end side header is spalled at both shoulders. The right side is worst with spalling 5 feet long x 5 inches wide x up to 2 inches deep (Photos 17 & 18). The elastic material is in poor condition and has pulled away from the concrete header in numerous locations with several gaps up to 0.5 inch wide (Photos 18 & 19).	17,18,19

ITEM	REMARKS	PHOTO NO.
TP 349-25	End Abutment – Bearings: The end bearing are expansion. The left fascia bearing B1 has cracked and peeling paint and the sole and masonry plates are rusted (Photo 20). All of the bearings are contracted. Bearing B1 is fully contracted at -5 ºF and the slider is 0.5 inch from the edge of the bottom slide plate (Photo 21). The interior bearings are in better condition and are in their normally contracted position at -5 ºF.	20,21
TP 349-27	End Abutment - Seats and Pedestals: Seat - The seat is generally in good condition with no hollow areas detected. In bay 1, there is a cracked patch at the left side (Photo 22).	22
	Pedestals - The left side of Pedestal P1 is mapcracked (Photo 23) and the left front corner is cracked and stained (Photo 24). See the End Abutment Deterioration Sketch. The remaining pedestals are in good condition with no significant cracks or hollow areas detected.	23,24
TP 349-29	End Abutment – Backwall: There is scattered tight hairline cracking with efflorescence throughout. There is leakage down the end left backwall resulting in cracking with efflorescence and, at the top, there is a 1 foot wide x 8 inches high x up to 4 inches deep spall (Photo 25). At the left side of bay 1, there is a 1 foot wide x 4 inches high x 4 inches deep spall; and a 2 square foot area of hollow sounding and crumbling concrete, and an up to 2 inches deep spall (Photo 26). In bays 1, 2 , & 3, there is surface scaling and pocks with efflorescence over 50% of the upper half of the surface (Photo 27). See the End Abutment Deterioration Sketch.	25,26,27
TP 349-31	End Abutment – Stem: The stem is tight hairline cracked over approximately 80% of the surface, particularly at the left and right sides. The left 1/4 is the worst area with surface scaling, staining and efflorescence (Photos 28). There are more pronounced hairline cracks scattered over the stem and a full height hairline crack near the centerline (Photo 29). See the End Abutment Deterioration Sketch.	28,29
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: The 2013 Biennial Inspection reported that there was gravel buildup at the end left approach pavement at the curbline that restricts runoff along the end left curbline (Photo 30). Snow cover prevented observation of that condition, however, there is evedence of seepage between the deck haunch and the top of the backwall at the left side (Photo 25).	25,30
TP 349-55	Approach - Settlement: There is no significant settlement at the begin approach. There is no significant settlement at the end approach, however, the deteriorated concrete joint header causes a bump with poor ride quality. (Photo 17).	17

ITEM	REMARKS	PHOTO NO.
TP 349-57	Approach - Pavement: At both approaches, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with up to 4 inches wide x up to 2 inches deep potholes along the concrete headers. (Photos 1 & 17). The gaps at the pavement joint allow runoff to seep into the pavement and abutment backfill. There is leakage evident down the begin and end left backwalls resulting in cracking and spalling of the backwalls. (Photos 10 & 25).	1,10,17 25
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth (Photo 31).	31
TP 350-20	Deck - Curbs: The curbs are granite in good condition. The right curb has 8.5 inches average curb reveal. The left curb reveal is 8 inches average.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – The right safety walk has tight mapcracking on the approximately 50% of the top surface (Photo 32). The left safety walk has light mapcracking throughout the top surface (Photo 33). No hollow sounding areas were detected.	32,33
	Fascias – The fascias have tight hairline mapcracking over 50% of the surface, primarily beneath the railing posts (Photo 34). There are scattered vertical hairline cracks (Photo 35). The vertical face of the right safety walk has several horizontal cracks with efflorescence leakage and staining (Photo 36). Also, at the begin right, there are several cracks with efflorescence in the lower deck portion of the fascia that wrap under the deck fascia bay (Photo 37).	34,35,36 37
TP 350-22	Deck - Railings: The railings are in good condition with only minor rust freckling of the galvanized surface (Photo 38). There is chain link snow fence attached to the left and right railings above I-481 SB. The fence fabric and pipe connections are in good condition.	38
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono-deck. SIP forms were not used. Records indicate the deck was repaired, the surface was scarified and it received a 1.75 inch concrete overlay in 1987.	
	Top of Deck - There is scattered random cracking with hollow areas throughout (Photos 39, 40) as illustrated in the Top of Deck Deterioration Sketch. The total hollow area is 1.5% of the surface.	39,40
	Underdeck – There is widespread hairline cracking throughout the underside of the deck (Photo 41). There are scattered more pronounced cracks, some with efflorescence (Photo 42). There are scattered cracked, delaminated and hollow sounding areas (Photos 43 & 44). The deteriorated areas are illustrated on the Under Deck Deterioration Sketch.	41,42,43 44

ITEM	REMARKS	PHOTO NO.
	The total damaged area of the underside of the deck is 0.4% of the area. The more significant areas are noted below: o Bay 1 in diaphragm bay 1 – 3 square foot area of hollow sounding concrete and cracks with efflorescence (Photo 43). o Bay 1 near the end of diaphragm bay 5 – 4 square foot area of hollow sounding delaminated concrete. o Bay 2 in diaphragm bay 2 – 4 square foot area of hollow sounding concrete. o Bay 2 at diaphragm 6 – 4 square foot area of cracking and hollow sounding concrete (Photo 44). o Right fascia bay at the beg right – cracks with efflorescence (Photo 37).	43 44 37
TP 350-28	Primary Members: Good condition; surface rusting where the paint has peeled or blistered. There is no significant section loss noted (Photo 45).	45
TP 350-29	Secondary Members: Good condition; surface rusting where the paint has peeled or blistered. There is no significant section loss noted.	
TP 350-30	Paint: The paint system is failed on 10% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges and scattered locations on the girder webs (Photo 45). The tops of the outside bottom flanges are worst with 50% of the surface having blistering and peeling paint (Photos 46 & 47). Also, the outside web of the left fascia girder has scattered blistering and peeling paint (Photo 46). There is surface rusting where the paint has peeled or blistered.	45,46,47
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None.	
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · Diaphragm gusset plate welded connections to bottom flanges of all girders.

Scale 1" = 10'

NOTES:
1. For General Notes see Sheet No. 124
2. For design purposes the foundation pressure does not exceed 2½ tons/s.f.
Three (3) months waiting period required after completion of backfilling behind abutments and prior to setting final pedestal elevations.
Duration of required waiting period may be reduced based upon analysis of settlement platform readings. Readings at one (1) week intervals taken at the settlement platforms in the vicinity of the abutments will be required after the completion of backfill operation.
3. For Curve Data see Alignment Plan, Sheet No. 40
4. The structural slab on this structure shall be formed with removable forms.
5. For end of bridge details, see sheet No 127

EPOXY POLYSULFIDE GROUT NOTE:

CONTRACTOR MAY WITH THE APPROVAL OF THE ENGINEER USE MATERIAL SPECIFICATION 721-03 EPOXY POLYSULFIDE GROUT, AT THE RECESSES, INSTEAD OF THE 12 HOUR CONTINUOUS PREWETTING REQUIREMENTS (PROJECT PROPOSAL). CONTRACTOR MUST ENSURE PROPER CONSTRUCTION PRACTICES ARE FOLLOWED WHEN USING THIS GROUT. THE USE OF EPOXY POLYSULFIDE GROUT SHALL BE AT NO ADDITIONAL COST TO THE STATE.

SEALS (mm)			ARMORED JOINT SYSTEM	
TYPE	NOMINAL WIDTH	DIM. "A" @ 20°C.	TYPE	END CONDITION
1	44	25	A1	Fixed End Only
2	51	30	A2	Exp. up to 18 m
3	64	38	A3	Exp. over 18 m to 23 m
4	76	44	A4	Exp. over 23 m to 27 m
5	89	52	A5	Exp. over 27 m to 38 m
6	102	60	A6	Exp. over 38 m to 46 m

Maximum Skew Limits: Fixed End - No Limit
Exp. End - 45° A2 thru A6

GENERAL NOTES:

1. THE TEMPERATURE OF THE BRIDGE MUST BE TAKEN ON THE STRUCTURAL STEEL SURFACE TO DETERMINE THE TEMPERATURE CORRECTION FOR THE JOINT OPENINGS.
2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE EIC FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.
   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ø ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02. GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL (MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB. IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC INCLUDING CONSTRUCTION TRAFFIC, AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

DETAILS ON THIS SHEET PERTAIN TO BIN'S 1072791, 1093520 & 1093540.

NOTES:

1) TO SEAL THE INTERFACE BETWEEN THE EXISTING ASPHALT APPROACH AND THE EXISTING ARMOR DECK ANGLE, USE A SILICONE JOINT SEALER FROM THE MATERIALS BUREAU APPROVED LIST.
2) THE SILICONE JOINT SEALER SHALL BE PLACED TRANSVERSELY FOR THE ENTIRE LENGTH OF THE ARMORED DECK ANGLE.
3) PRIOR TO PLACEMENT OF THE SILICONE JOINT SEALER THE AREA SHALL BE CLEANED AND FREE OF ANY LOOSE MATERIAL TO THE SATISFACTION OF THE ENGINEER.
4) REFER TO DWG. NO. JT-2 AND JT-3 FOR ADDITIONAL INFORMATION.
5) NO PLAN VIEW SHOWN FOR THESE STRUCTURES.
6) REFER DWG. NO. JD-43, FOR ADDITIONAL INFORMATION BIN 1072791.

WORK TO BE DONE:

BIN 1072791 -

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1093520
Interstate Route I-690 West Bound Ramp
over Interstate Route I-481 South Bound

Prepared for:

New York State
Department of Transportation

PIN 3056.13.111

LaBella Project No. 201001

August 2001

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-690 West Bound Ramp over Interstate Route I-481. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1093520 – Interstate Route I-690 West Bound Ramp over Interstate Route I-481

Type of Material	Estimated Amount
Sheet Packing	7.8 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-690 West Bound Ramp over Interstate Route I-481. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1093520 – Interstate Route I-690 West Bound Ramp over Interstate Route I-481

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 7.8 square meters. This estimate is based on field measurements taken at the time of the site visit. The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: APRIL 2, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093520 (I-690 EB / I-481 SB)

This memorandum summarizes the seismic screening conducted for BIN 1093520 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JANUARY 26, 2015

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093520 (I-690 Eastbound Ramp / I-481 Southbound)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has been **exhausted.**

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, Gusset plate welds	55.27	391.74
Exterior Girders, Gusset plate welds	-8.60	77.46

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 1.5% of the top and 0.4% of the underside of the deck area. The cores indicate the reinforcement steel is 4.25 inches to 4.5 inches below the surface of the deck. The lab test indicate that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Damaged areas at the underside of the deck will require full depth reconstruction. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. Reinforcement with significant section loss will be replaced. Partial and full depth removal areas will be reconstructed to adjacent grade. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will be removed. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6.5 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $426,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $494,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are fixed. The steel armor angle was removed and replaced with a concrete pavement transition header. At the top, there is no joint visible. The transition header is cracked along the begin edge near the left shoulder (Photo 1) and transverse cracked in the travel lanes (Photo 2). Under the deck, the pad at the top of the backwall has "walked" and is hanging down in bays 4, 5, & 6 (Photo 3). There is leakage down the backwall and the abutment stem beneath girder bays 6, 7, & 8 (Photos 3 & 4).	1,2,3,4
TP 349-24	Begin Abutment – Bearings: The begin bearings are fixed. All of the bearings have pack rust between the rocker and the masonry plate that restricts movement (Photo 5). The fascia bearing B9 is wet and in the worst condition (Photo 6). The anchor bolts at bearing B9 are dull sounding when struck and may be sheared off below the masonry plate.	5,6
TP 349-26	Begin Abutment - Seat and Pedestals: The seats and pedestals are in good condition with no hollow areas or significant cracks detected.	
TP 349-28	Begin Abutment – Backwall: There is tight mapcracking with dampness and efflorescence staining from leakage down the backwall (Photos 3, & 4). The worst is the upper half beneath girder bay 8 and the right side. At the upper right, there is a 4 square foot hollow sounding area with a small spall above (Photo 7). See the Begin Abutment Deterioration Sketch.	3,4,7
TP 349-30	Begin Abutment – Stem: The stem has been recently repaired, cleaned and a surface sealant applied. No hollow areas or significant cracks were detected. (Photo 8). The right side is wet from leakage down the backwall. The right side has an old repair that has an estimated 25 square foot area of map cracking (Photo 9). See the Begin Abutment Deterioration Sketch.	8,9
TP 349-32	Begin Abutment – Erosion: The paving block slope has scattered areas of deterioration with an estimated 40 square foot total area of settled and deteriorated blocks (Photo 8).	8
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end bearings are expansion. The end joint with deck is steel armor compression seal type in poor condition with several repairs evident (Photo 10). In the left lane, the end side concrete header, the steel armor angle and the compression seal have been removed and replaced with armorless elastomeric header with a filled elastic material seal (Photo 11). The seal has pulled away from both sides and there are +/- ¼ inch gaps along the seal. The remaining steel armor angle is rusted throughout and bent at several locations from impact damage (Photo 12). The remaining compression seal is raised in the right lane and torn at scattered locations (Photo 10).	10,11,12

ITEM	REMARKS	PHOTO NO.
TP 349-25	End Abutment – Bearings: The end bearings are expansion. The fascia bearings B1 & B9 are rusted. (Photo 13). The interior bearings are in better condition (Photo 14). All of the bearings are extended at 40 ºF with the end of the slider plate at the back edge of the masonry plate (Photo 15) .	13,14,15
TP 349-27	End Abutment - Seats and Pedestals: The seat is in generally good condition. Pedestal P9 is damp and mapcracked throughout the left side. Also, on the left side, there are two cracks; one near the front, and the second at the rear (Photo 16). The remainder of the pedestals are in good condition with no hollow areas or significant cracks detected.	16
TP 349-29	End Abutment – Backwall: There are areas of tight hairline mapcracking covering 50% of the surface area of the backwall. The worst areas are at the right side in girder bays 7 & 8 and the right fascia bay. There is a full height vertical crack in bay 3 (Photo 17). There is a 4 square foot x 6 inches deep spall along the top edge behind girder G9 with leakage staining of the backwall (Photo 18). See the End Abutment Deterioration Sketch.	17,18
TP 349-31	End Abutment – Stem: The stem has been recently repaired, cleaned and a surface sealant applied. Toward the right side there is leakage stains and an old patch area is mapcracked with efflorescence (Photo 19). No hollow areas or significant cracks were detected. See the End Abutment Deterioration Sketch.	19
TP 349-33	End Abutment – Erosion: Erosion – The paving block slope protection at the left and right sides is deteriorated with settled and deteriorated blocks over a 30 square foot area (Photo 19).	19
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: The begin right approach pavement at the curbline is ½ inch higher than the begin edge of the deck which traps runoff with shallow ponding on the deck along the begin right curbline (Photo 20).	20
TP 349-55	Approach - Settlement: The begin asphalt pavement has been recently repaved and there is no settlement at the begin approach (Photo 21). At the end approach, there is +/- 0.75 inch of settlement (Photo 22).	21,22
TP 349-57	Approach - Pavement: The begin asphalt pavement has been recently repaved. At the end approach, the asphalt pavement adjacent to the bridge is transverse cracked (Photo 10).	10

ITEM	REMARKS	PHOTO NO.
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth (Photo 23). There is slight wear of the transverse traction grooving in the wheel paths.	23
TP 350-20	Deck - Curbs: The granite curbs are in good condition (Photo 24). The right curb has 8.25 inches average curb reveal. The average left curb reveal is 8.75 inches.	24
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – The left safety walk has light mapcracking on approximately 50% of the top surface (Photo 25). No hollow sounding areas were detected. The right safety walk has tight mapcracking on approximately 75% of the top surface. There are several larger width cracks and small spalls. At railing bay 8, there is a 12 inches long x 3 inches wide x 1.5 inches deep spall; and a 2 feet long x 4 inches wide spall that wraps around along the vertical face of the right fascia (Photo 26). The concrete surrounding the spalls is damp and crumbly. See the Top of Deck Deterioration Sketch.	25,26
	Fascias – The left fascia has tight mapcracking of the surface over 10% of the surface, primarily beneath the railing posts (Photo 27). Also, there are scattered vertical cracks (Photo 28). There is a minor crack and spall with a less than 1 square foot delamination under left side railing post 11. The right fascia is tight mapcracked throughout. The begin right fascia has two spalled areas up to 2 inches deep (Photo 29). The vertical face of the upper safety walk portion has several horizontal cracks with efflorescence leakage and staining (Photo 30). Beneath railing bay 8, the upper fascia is spalled 2 feet long x full height x up to 2 inches deep with exposed rusted reinforcement (Photo 31). The concrete at the spalls is damp and crumbly. Loose chunks of concrete were removed during this inspection.	27,28,29 30,31
TP 350-22	Deck - Railings: The railings are in good condition with only minor rust speckling of the galvanized surface (Photo 32). The right side railing rail connections are rusted (Photo 33). There is chain link snow fence attached to the left and right railings above the I481 NB to I690 WB ramp. On the left, the fence fabric and pipe connections are in good condition. On the right, the fence fabric is in good condition; however, the lower horizontal pipe connections to the vertical pipe posts are rusted. (Photo 34).	32,33,34
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono-deck. SIP forms were not used. Records indicate the deck was repaired, the surface was scarified and it received a 1.75 inch concrete overlay in 1987.	
	Top of Deck - There are scattered random cracking and hollow areas (Photos 35 & 36); and several patches in good condition (Photo 37) as illustrated in the Top of Deck Deterioration Sketch. The total hollow area is 4% of the surface.	35,36,37

ITEM	REMARKS	PHOTO NO.
	Underdeck – The underside of the deck is hairline mapcracked throughout (Photo 38). There are scattered cracks, some with efflorescence, delaminations, hollow areas, and damp areas. There are several spalls, some with exposed rusted reinforcing bars; and a large area of protective shoring. The total damaged area, including the shored area is 2.8% of the surface. The deteriorated areas are illustrated on the Under Deck Deterioration Sketch; and significant areas noted below:	38
	• Bay 1 at begin – 4 square foot area of mapcracking, dampness with efflorescence (Photo 39).	39
	• Bay 3 diaphragm bay 3 – cracked and 2 square foot hollow area (Photo 40).	40
	• Bay 4 in diaphragm bay 2 – cracked with 2 square foot hollow area.	
	• Bay 5 scattered locations near diaphragm 6 – patched areas in good condition (Photo 41).	41
	• Bay 5 in diaphragm bay 2 - 6 square foot area of map cracking with dampness and efflorescence.	
	• Bay 6 diaphragm bay 2 – 75 square foot area of mapcracking; cracking; dampness, efflorescence and stalactites. Additionally, there is approximately 15 feet long x full bay width of shoring (Photo 42).	42
	• Bay 7 near mid-span – 6 square foot area of mapcracking and dampness.	
	• Bay 8 near begin – 15 square foot area spalled 2 inches deep with exposed rusted reinforcement. There are 6 transverse bars exposed – 1 bar rusted through and the remainder with 50% section loss. There are 5 longitudinal bars exposed and rusted but they are mostly bonded (Photo 43).	43
	• Bay 8 near mid-span – 4 square foot area of mapcracking and dampness.	
TP 350-28	Primary Members: The primary members are in good condition with only surface rusting where the paint has blistered or peeled (Photo 44). No significant section loss was noted.	44
TP 350-29	Secondary Members: The secondary members (diaphragms) are in good condition with only surface rusting where the paint has blistered or peeled. No significant section loss was noted.	
TP 350-30	Paint: The paint system is failed on approximately 10% of the surfaces of the girders and diaphragms. There is widespread cracking and peeling of the paint on the bottom flanges, most severely over the travel lanes (Photos 44, 45, & 46). There is surface rusting where the paint has peeled or blistered. The lower half of the webs have scattered blistering and peeling paint. The right fascia is the worst with 5% of the surface cracked, peeling or blistered (Photo 47 & 48). The remaining paint is faded and chalky.	44,45,46 47,48

ITEM	REMARKS	PHOTO NO.
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: There is an sign structure attached to the right fascia girder (Photo 48).	48
TP 350-45	Utilities and Support: None.	
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · Diaphragm gusset plate welded connections to bottom flanges of all girders.

Notes:
1. For General Notes see sheet No. 124
2. For design purpose the foundation pressure does not exceed 2½ tons/SF
3. Three (3) months waiting period required after completion of backfilling behind abutments and prior to setting final pedestal elevations.
4. Duration of required waiting period may be reduced by the Deputy Chief Engineer (Design) based upon analysis of settlement platform readings. Readings at one (1) week intervals taken at settlement platforms in the vicinity of the abutments will be required after the completion of the backfill operation.
5. For curve data see Alignment plan Sheet No. 40
6. The structural slab on this structure shall be formed with removable forms
7. For end of bridge details, see sheet no. 127

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1093530
Interstate Route I-481 South Bound
over Interstate Route I-690

Prepared for:

New York State
Department of Transportation

PIN 3056.13.111

LaBella Project No. 201001

August 2001

BIN 1093530
Interstate Route I-481 South Bound over Interstate Route I-690

Note:

The above referenced bridge was previously surveyed for the presence of asbestos-containing materials (ACMs) in March of 2001. Based on laboratory analyses of bulk samples collected at that time, the following material was determined to contain asbestos:

Type of Material	Estimated Amount
Sheet Packing	11 square meters

See LaBella Associates report, dated March 2001 (NYSDOT PIN 3804.52.101) for more information.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 South Bound bridge over Interstate Route I-690. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1093530 Interstate Route 481 South Bound over Interstate Route I-690

Type of Material	Estimated Amount
Sheet Packing	11 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 South Bound bridge over Interstate Route I-690 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1093530 Interstate Route I-481 South Bound over I-690

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations. It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 11 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: APRIL 2, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093530 (I-481 SB/ I-481 NB Ramp to I-690 WB)

This memorandum summarizes the seismic screening conducted for BIN 1093530 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JANUARY 26, 2015

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093530 (I-481 Southbound / I-481 Northbound to I-690 Westbound Ramp)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has been **exhausted.**

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, Gusset plate welds	3.94	139.13
Exterior Girders, Gusset plate welds	-16.74	37.39

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 4% of the top and 2.8% of the underside of the deck area. The cores indicate the reinforcement steel is 4 inches below the surface of the deck. The lab test indicate that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Damaged areas at the underside of the deck will require full depth reconstruction. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. Reinforcement with significant section loss will be replaced. Partial and full depth removal areas will be reconstructed to adjacent grade. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove the portion of the deck with the highest chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6.25 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $663,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $775,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are expansion. There are concrete headers and there is no steel armor visible from the surface. The joint material is a filled elastic material (Photo 1). The concrete headers are in poor condition. Both headers are cracked at one foot to 3 foot intervals and spalled at numerous locations. The begin header on the left side and both headers on the right side are the worst with spalling up to 5 feet long x up to full width of the header x up to 2 inches deep (Photos 1). The seal material is in poor condition. The seal has pulled away from both sides at numerous locations and there are +/- ¼ inch gaps along the seal (Photo 2). There is leakage and seepage down the left side of the backwall (Photo 3).	1,2,3
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion. The fascia bearings are heavily corroded (Photo 4). The interior bearings are in better condition. Bearings B1 and B2 are at a normal contracted position at 30 ºF. Bearings at B3 thru B5 are fully contracted. The worst is bearing B4 with the front edge of the sliding plate overhanging the masonry plate by ¼ inch (Photo 5).	4,5
TP 349-26	Begin Abutment - Seat and Pedestals: The seat in good condition with no hollow areas or significant cracks detected. Pedestal P1 is tight mapcracked on the left side (Photo 4). Pedestal P2 is cracked at the left and right sides; and the front left side has 1 square foot area of hollow sounding concrete (Photo 6). The remaining pedestals are in good condition with no significant cracks or hollow areas detected.	4,6
TP 349-28	Begin Abutment – Backwall: There is tight mapcracking with light efflorescence throughout the backwall (Photo 7). At the top of the left fascia bay, there is a 15 inches wide x 1 foot high x 10 inches deep spall and cracked segmented concrete with exposed debonded reinforcement (Photo 3). There is crumbly concrete surrounding the spall with seepage and heavy efflorescence down the backwall. See the Begin Abutment Deterioration Sketch.	3,7
TP 349-30	Begin Abutment – Stem: The stem has tight mapcracking throughout. The left side is hairline cracked in a previously patched area (Photo 8). There are scattered hairline cracks as illustrated on Begin Abutment Deterioration Sketch.	8
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end bearings are fixed. There is no joint visible from above. The concrete pavement transition header at the end of the deck is deteriorated with cracks at 2 to 3 foot intervals and the right side is spalled 5 feet wide x 2 inches deep and (Photo 9).	9

ITEM	REMARKS	PHOTO NO.
TP 349-25	End Abutment – Bearings: The end bearings are fixed. All of the bearings have cracked and peeling paint with heavy corrosion and pack rust between the rockers and the masonry plates that restricts movement (Photo 10). The worst is the left fascia bearing B1 where there is seepage down the backwall onto the bearing (Photo 11).	10,11
TP 349-27	End Abutment - Seats and Pedestals: The seat is in good condition with no hollow areas or significant cracks detected. Pedestal P1 is mapcracked on the left side and there is a crack toward the back of the left side that wraps along the top with shallow spalls along the crack (Photo 12). The right side of pedestal P1 is mapcracked (Photo 13). Pedestal P5 is cracked at the top right and along the right side (Photo 14). There are scattered cracks on the remainder of the pedestals as illustrated on the End Abutment Deterioration Sketch.	12,13,14
TP 349-29	End Abutment – Backwall: There is tight mapcracking with light efflorescence throughout the backwall. The worst is at the left where there is seepage down the backwall (Photo 15). At the top of the left fascia bay, there is an 18 inches wide x 1 foot high x 6 inches deep spall with exposed debonded reinforcement (Photo 16). There is crumbly concrete surrounding the spall with seepage and heavy efflorescence down the backwall. At the right fascia bay, the top is cracked with 3 inches diameter shallow spalls along the cracks (Photo 17). The surface is damp with efflorescence. There are scattered cracks on the remainder of the backwall as illustrated on the End Abutment Deterioration Sketch.	15,16,17
TP 349-31	End Abutment – Stem: Toward the left side there is leakage stains and mapcracked with efflorescence (Photo 18). No hollow areas or significant cracks were detected. There are scattered hairline cracks as illustrated on End Abutment Deterioration Sketch.	18
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: The bridge is superelavated from left to right and has a negative slope from begin to end. The pavement has settled slightly along the begin left approach curbline at the bridge trapping runoff at the begin left transition header and causing shallow ponding along the curbline (Photo 19). Additionally, the end left approach pavement at the curbline is +/- 0.5 inch higher than the end side joint header and runoff is trapped and causes shallow ponding and buildup of dirt along the end left curbline (Photo 20).	19,20
TP 349-55	Approach - Settlement: The begin approach has 0.5 inch of settlement (Photo 21). At the end approach, there is no significant settlement, however, the deteriorated concrete transition header causes a bump with poor ride quality (Photo 9).	9,21
TP 349-57	Approach - Pavement: At both approaches, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with up to 2 inches wide x up to 1.5 inches deep potholes along the concrete headers (Photos 1 & 21).	1,21

ITEM	REMARKS	PHOTO NO.
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth (Photo 22).	22
TP 350-20	Deck - Curbs: The granite curbs are in good condition. The right curb has 9 inches average curb reveal. The average left curb reveal is 8.5 inches.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – The safety walks have light mapcracking on approximately 50% of the top surface (Photo 23). No hollow sounding areas were detected.	23
	Fascias – Both fascias have tight mapcracking of the surface over 10% of the surface, primarily beneath the railing posts (Photo 24). Also, there are scattered vertical cracks (Photo 25). There is horizontal cracking just below the upper portion of the fascia over 50% of the span length. Most of this crack is tight with some efflorescence, however, a +/- 10 foot long section near mid-span is spalled along the crack up to 1 inch high x 1 inch deep with staining (Photo 26).	24,25,26
TP 350-22	Deck - Railings: The railings are in good condition with only minor rust speckling of the galvanized surface (Photo 27). The 2nd railing post on the left side has the begin inside bolt missing (Photo 28). The last railing post on the left side has impact damage and is bent 4 inches toward the end from vertical at the base (Photo 29). The post and railings are still attached, firm and in alignment. There is chain link snow fence attached to the left and right side railings above the I481 NB ramp to I690 WB in good condition.	27,28,29
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono-deck. SIP forms were not used. Records indicate the deck was repaired, the surface was scarified and it received a 1.75 inch concrete overlay in 1987.	
	Top of Deck - There is widespread cracking and scattered random hollow areas (Photos 30 & 31) as illustrated in the Top of Deck Deterioration Sketch. Several of the cracks have been sealed with an epoxy crack sealer (Photo 32). The total hollow area is less than 1% of the surface.	30,31,32
	Underdeck – The underside of the deck is hairline mapcracked throughout (Photo 33). There are scattered cracks, some with efflorescence, delaminations, hollow areas, and damp areas. The total damaged area is 1.9% of the surface. The deteriorated areas are illustrated on the Under Deck Deterioration Sketch; and significant areas noted below:	33
	• Bay 1 near end – cracked and 20 square foot area of hollow and delaminated concrete with 2 – 12 inches wide x 6 inches long x 1 inch deep spalls (Photo 34).	34
	• Bay 2 in diaphragm bay 5 – patched area in good condition with adjacent 2 square foot area of cracked and hollow sounding concrete (Photo 35).	35
	• Bay 3 near diaphragm 3 - transverse crack with 3 square foot area of hollow sounding concrete.	

ITEM	REMARKS	PHOTO NO.
	• Bay 4 near begin - 4 square foot area of mapcracking and hollow sounding concrete (Photo 36).	36
	• Bay 4 diaphragm bay 2 – 28 square foot area of patch in good condition (Photo 37).	37
	• Bay 4 near end – 16 square foot area of mapcracking and hollow sounding concrete with efflorescence.	
TP 350-28	Primary Members: The primary members are in good condition with only surface rusting where the paint has blistered or peeled (Photo 38). No significant section loss was noted.	38
TP 350-29	Secondary Members: The secondary members (diaphragms) are in good condition with only surface rusting where the paint has blistered or peeled. No significant section loss was noted.	
TP 350-30	Paint: The paint system is failed on approximately 10% of the surfaces of the girders and diaphragms. There is widespread cracking and peeling of the paint on the bottom flanges, most severely over the travel lanes (Photo 38). The lower half of the outside web of the right fascia girder G5 has scattered blistering and peeling paint over 5% of the surface (Photo 39). The inside web of the right fascia girder has widespread cracked, peeling or blistered paint over approximately 10% of the surface (Photo 40). There is surface rusting where the paint has peeled or blistered. The remaining paint is faded but not yet chalky.	38,39,40
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None visible.	
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · Diaphragm gusset plate welded connections to bottom flanges of all girders.

NOTES:
1. For General Notes see Sheet No. 124
2. For design purposes the foundation pressure does not exceed 2½ tons/s.f. Three (3) months waiting period required after completion of backfilling behind abutments and prior to setting final pedestal elevations. Duration of required waiting period may be reduced by the Deputy Chief Engineer (Design) based upon analysis of settlement platform readings. Readings at one (1) week intervals, taken at the settlement platforms in the vicinity of the abutments will be required after the completion of backfill operation.
3. For Curve Data see Alignment plan, Sh. No. 40
4. The structural slab on this structure shall be formed with removable forms.
5. For end of bridge details, see sheet No. 127

EPOXY POLYSULFIDE GROUT NOTE:

CONTRACTOR MAY WITH THE APPROVAL OF THE ENGINEER USE MATERIAL SPECIFICATION 721-03 EPOXY POLYSULFIDE GROUT, AT THE RECESSES. INSTEAD OF THE 12 HOUR CONTINUOUS PREWETTING REQUIREMENTS (PROJECT PROPOSAL). CONTRACTOR MUST ENSURE PROPER CONSTRUCTION PRACTICES ARE FOLLOWED WHEN USING THIS GROUT. THE USE OF EPOXY POLYSULFIDE GROUT SHALL BE AT NO ADDITIONAL COST TO THE STATE.

SEALS (mm)			ARMORED JOINT SYSTEM	
TYPE	NOMINAL WIDTH	DIM. "A" @ 20°C.	TYPE	END CONDITION
1	44	25	A1	Fixed End Only
2	51	30	A2	Exp. up to 18 m
3	64	38	A3	Exp. over 18 m to 23 m
4	76	44	A4	Exp. over 23 m to 27 m
5	89	52	A5	Exp. over 27 m to 38 m
6	102	60	A6	Exp. over 38 m to 46 m

Maximum Skew Limits: Fixed End - No Limit
Exp. End - 45° A2 thru A6

LIST OF ITEMS USED:

ITEM 555.09M - STRUCT. CONCRETE, CLASS "HP" (CM)
ITEM 556.0202M - EPOXY COATED BAR REINF. FOR STRUCT. (KG)
ITEM 567.31M - MOD. ARMORED JOINT SYSTEM W/ COMP. SEAL TYPE A1 (m)
ITEM 567.32M - MOD. ARMORED JOINT SYSTEM W/ COMP. SEAL TYPE A2 (m)
ITEM 567.35M - MOD. ARMORED JOINT SYSTEM W/ COMP. SEAL TYPE A5 (m)
ITEM 567.36M - MOD. ARMORED JOINT SYSTEM W/ COMP. SEAL TYPE A6 (m)
ITEM 18567.46M - ELASTOMERIC CONC. FOR BRIDGE JT. SYSTEMS (M)
ITEM 586.01M - DRILL & GROUT REINF. BARS (mm)

GENERAL NOTES:

1. THE TEMPERATURE OF THE BRIDGE MUST BE TAKEN ON THE STRUCTURAL STEEL SURFACE TO DETERMINE THE TEMPERATURE CORRECTION FOR THE JOINT OPENINGS.
2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M. AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE EIC FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.
   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ⌀ ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02. GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL (MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB. IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC INCLUDING CONSTRUCTION TRAFFIC, AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

DETAILS ON THIS SHEET PERTAIN TO BIN'S 1072791, 1093520 & 1093540.

NOTES:

1) TO SEAL THE INTERFACE BETWEEN THE EXISTING ASPHALT APPROACH AND THE EXISTING ARMOR DECK ANGLE, USE A SILICONE JOINT SEALER FROM THE MATERIALS BUREAU APPROVED LIST.
2) THE SILICONE JOINT SEALER SHALL BE PLACED TRANSVERSELY FOR THE ENTIRE LENGTH OF THE ARMORED DECK ANGLE.
3) PRIOR TO PLACEMENT OF THE SILICONE JOINT SEALER THE AREA SHALL BE CLEANED AND FREE OF ANY LOOSE MATERIAL TO THE SATISFACTION OF THE ENGINEER.
4) REFER TO DWG. NO. JT-2 AND JT-3 FOR ADDITIONAL INFORMATION.
5) NO PLAN VIEW SHOWN FOR THESE STRUCTURES.
6) REFER DWG. NO. JD-43, FOR ADDITIONAL INFORMATION BIN 1072791.

WORK TO BE DONE:

BIN 1072791 -

REPLACE EXISTING COMPRESSION SEALS AT BOTH ABUTMENTS.
BEG. ABUT. (WEST) EXISTING TYPE A-1 ARMORED JOINT SYSTEM
END ABUT. (EAST) EXISTING TYPE A-5 ARMORED JOINT SYSTEM

LaBella Project No. 201001

August 2001

BIN 1093540
Interstate Route I-481 North Bound On Ramp over Interstate Route I-690

Note:

The above referenced bridge was previously surveyed for the presence of asbestos-containing materials (ACMs) in March of 2001. Based on laboratory analyses of bulk samples collected at that time, the following material was determined to contain asbestos:

Type of Material	Estimated Amount
Sheet Packing	6 square meters

See LaBella Associates report, dated March 2001 (NYSDOT PIN 3804.52.101) for more information.

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 North bound On Ramp bridge over Interstate Route I-690. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1093540 Interstate Route I-481 North Bound On Ramp over Interstate Route I-690

Type of Material	Estimated Amount
Sheet Packing	6 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 North bound On Ramp bridge over Interstate Route I-690 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Inspection Notes

Carried: I690EB-I481NBRAMP Crossed: 690I 690I33013016 CheckValue: 1,819,672,191

Note ID: 331310935400002

Beg Abut -- Abutment: Joint with Deck -- Rated 3, Was 3
Referenced Photos: "11"
2013 - The begin joint headers, are spalled and cracked. There are several areas of sealer that have holes through. The asphalt next to the concrete header has "pulled away" or spalled away from the header, creating a gap. The end right half of pavement joint header is surface spalling away.

Note ID: 331310935400000

Approaches: Drainage -- Rated 5, Was 5
Referenced Photos: "9"
2013- Right side beginning and end approaches have vegetation and sand buildup along the curbs preventing proper drainage from off the bridge.

Note ID: 331310935400009

Approaches: Erosion -- Rated 4, Was 4
Referenced Photos: "2"
2013 - The end left has an erosion gully at the end of the previously placed stone approx. 10' wide by 4' deep.

Note ID: 331310935400006

Approaches: Pavement -- Rated 4, Was 4
Referenced Photos: "3"
2013 - The begin joint headers, on the right half, are spalled and cracked. There are several areas of sealer that have holes through. The asphalt next to the concrete header has "pulled away" or spalled away from the header, creating a gap. The end right half of pavement joint header is surface spalling away.

Note ID: 331310935400005

Approaches: Guide Railing -- Rated 4, Was 4
Referenced Photos: "4", "5"
2013 - The end right approach guiderail has 9 posts that are bent and broken away from the top box rail. The top rail is disconnected for 40 feet.

Note ID: 331310935400007

Span 001 -- Superstructure: Structural Deck -- Rated 4, Was 4
Referenced Photos: "6", "15", "19", "20"
2013 - The deck is hairline mapcracked throughout, but there are delaminations and hollow areas in bay 1, begin and end. The areas of delaminations are not over traffic or pedestrians and therefore not safety flagged.

Inspection Date: 5/30/2013 RC: 33 BIN: 1093540

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: APRIL 3, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093540 (I-690 EB to I-481 NB Ramp / I-481 NB Ramp to I-690 WB)

This memorandum summarizes the seismic screening conducted for BIN 1093540 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JANUARY 26, 2015

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093540 (I-690 Eastbound / I-481 Northbound)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below. The remaining safe fatigue life of the fatigue components has been **exhausted.**

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)	Remaining Mean Fatigue Life (Years)
Interior Girders, Gusset plate welds	29.07	262.81
Exterior Girders, Gusset plate welds	-12.56	57.97

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0.9% of the top and 1.9% of the underside of the deck area. The core bit hit the reinforcement matt at a depth of 6 inches. The lab test indicates that chloride ion concentrations at one of the three sample locations of core C1 are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Damaged areas at the underside of the deck will require full depth reconstruction. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. Reinforcement with significant section loss will be replaced. Partial and full depth removal areas will be reconstructed to adjacent grade. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove the portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $420,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $475,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

STRUCTURE IDENTIFICATION

a. Bridge Identification Number (BIN): 3/3 1093550
b. Reference Marker: 481I 3301 2060
c. Region: NYSDOT Region 3
d. County: Onondaga
e. Town: Dewitt
f. Feature Carried: I-481 Northbound
g. Feature Crossed: Connection to I-690 Westbound

INTRODUCTION

a. Bridge History
   i. Year Built: 1972
   ii. Bridge Type: Single Span, Steel Multi-girder
   iii. Span Length: 150 feet
   iv. Out-to-Out Width: 43 feet
   v. Skew Angle: 51°
   vi. Structural Ratings and Rankings
      1. Federal Sufficiency: 79 (Apr. 2011)
      2. Condition Rating: 4.422 (Apr. 2011)
      3. General Recommendation: 5 (Apr. 2011)
   vii. Live Load Posting (HS25): No
   viii. National Highway System (NHS): Yes
   ix. Previous work Done:

1987 – Replace wearing surface (asphalt concrete overlay) with concrete overlay
1992 – Clean and paint metal surfaces
2004 – Remove end arm angles, repair exp. Bearings; abutment concrete repairs
2010 – Clean and paint metal surfaces
2013 – Deck replacement; bearing repairs; abutment repairs.

   x. Planned Future Work: N/A

b. Highway Classification

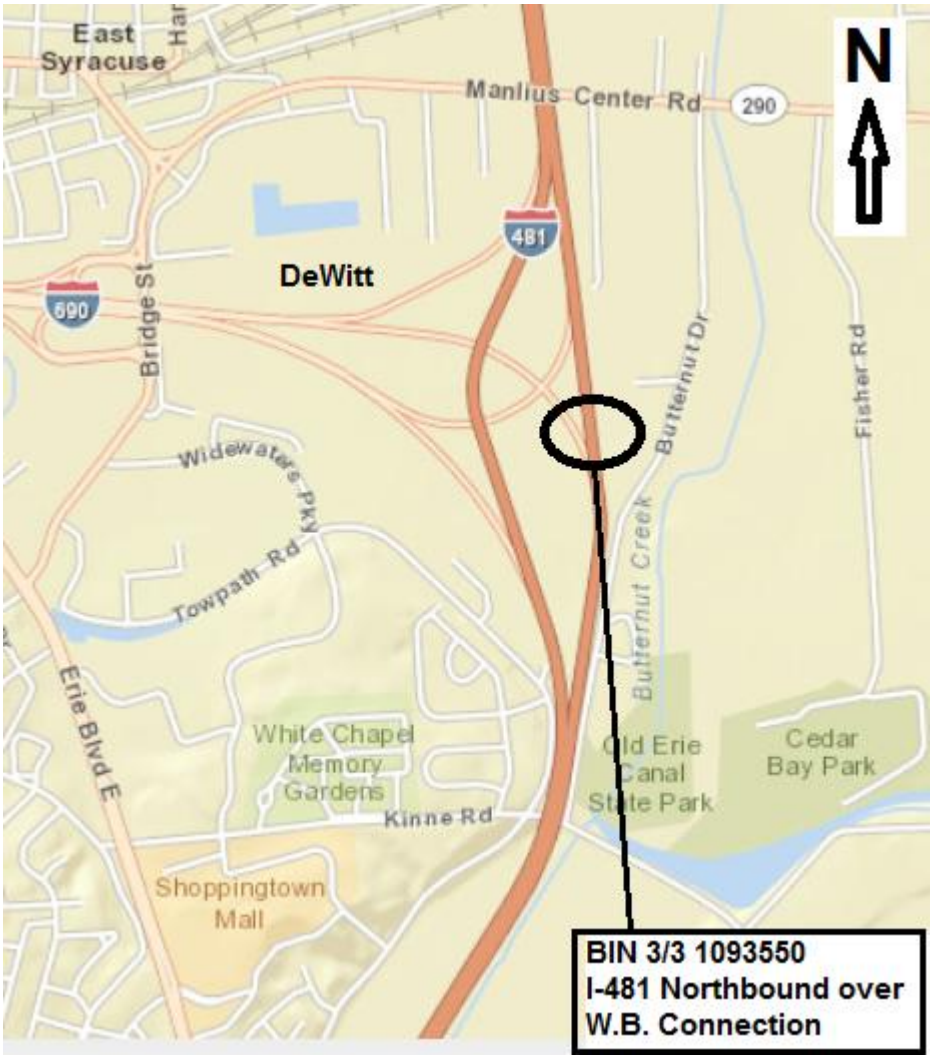
i. Functional Classification: Urban Principle Arterial - Interstate

ii. Traffic Volumes

YEAR	AADT
2014	25226
2034	37485
2054	55700

iii. Plan for Maintenance and Protection of Traffic:
Maintenance and protection of traffic will be achieved by staged construction.

PROJECT LOCATION MAP



IN-DEPTH CONDITION DOCUMENTATION

NYS DEPT. OF TRANSPORTATION **SHEET: 1 OF 4**
BRIDGE INSPECTION REPORT **BIN: 1093550** **DATE: 2/6/2014 & 2/24/2014**

FEATURE CARRIED: I-481 NB **TEAM LEADER: G. STAM**
FEATURE CROSSED: CONNECTION to I690 WB **ASSIST. TEAM LEADER: T. OLMSTEAD**

ITEM	REMARKS	PHOTO NO.
	GENERAL NOTE The entire bridge deck was replaced in 2013 with a new concrete mono-deck. There is an expansion joint at the begin approach and no joint at the end approach. The deck element curbs, safety walks, railings, and fascias were replaced with concrete single slope parapets.	
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are expansion. The begin joint is armorless with elastomeric concrete headers and elastic material seal (Photo 1). The seal is debonded from the headers on approximately 50 percent of the length of the joint (Photo 2). The debonded seal allows runoff to leak down the backwall and onto the substructure elements below (Photo 3). There is leakage evident at the begin left backwall (Photo 4). Additionally, there is seepage through the construction joint mid-height of the backwall (Photo 5). The elastic material between the expansion joint of the right parapet is debonded from the sides with gaps up to 0.75 inch (Photo 6).	1,2,3,4 5,6
TP 349-24	Begin Abutment – Bearings: The begin bearings are expansion. All of the bearings appear to be functioning and are in there normally contracted position at 10 ºF. The right keeper plate at bearing B1 is bent outward slightly (Photo 7), however, the bearing is still in proper alignment. The right keeper plate at bearing G4 is similar, but not as severe. The left anchor bolt at bearing B1 is dull sounding when struck with a hammer and is likely sheared off (Photo 8).	7,8
TP 349-26	Begin Abutment - Seat and Pedestals: The seat is in good condition. The pedestals are in generally good conditions with the following deficiencies noted: • Pedestal P2 - cracked along the left side and top at the rear with 1 square foot of hollow sounding area (Photo 9). The crack extends along the top of the pedestal to the bearing plate near the left anchor bolt. The bolt sounds solid. • Pedestal P3 – cracked at the right side at the rear (Photo 10); and at the right side of the front face (Photo 11). • Pedestal P5 – cracked at the begin left side (Photo 12).	 9 10,11 12
TP 349-28	Begin Abutment – Backwall: The begin backwall is in good condition with no significant cracks or hollow sounding areas detected. There is leakage down the backwall in girder bays 2 and 3. Additionally, there is seepage through the construction joint mid-height of the backwall (Photo 5).	5
TP 349-30	Begin Abutment – Stem: The stem has scattered tight mapcracking throughout (Photo 13). Additionally, there are scattered hairline vertical cracks as illustrated on the Begin Abutment Deterioration Sketch (Photo 11).	11,13

ITEM	REMARKS	PHOTO NO.
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end bearings are fixed. There is no joint at the end abutment.	20
TP 349-25	End Abutment – Bearings: The end bearings are fixed and in good condition. The left side anchor bolts of bearings B1, B3, & B6 are missing, however, they have been repaired with angles welded to the sides of the masonry plates and anchored to the pedestals (Photo 14).	14
TP 349-27	End Abutment - Seats and Pedestals: The seats and pedestals are in generally good condition. The begin right side of pedestal P2 is cracked with a 0.5 square foot area of hollow sounding concrete (Photo 15). There were no other no hollow areas or significant cracks detected.	15
TP 349-29	End Abutment – Backwall: The backwall is in good condition with no significant cracks or hollow areas detected.	
TP 349-31	End Abutment – Stem: The stem has scattered hairline vertical and mapcracking throughout as illustrated on the End Abutment Deterioration Sketch (Photo 16). There is an area of more defined mapcracking of the stem below pedestal 3 (Photo 17). The top edge of the right nose at the stem and right wingwall interface is cracked with surface spalls (Photo 18).	16,17,18
	APPROACH ITEMS	
TP 349-53	Approach Drainage: The bridge generally slopes from begin to end. The end right corner of the end approach slab is slightly higher than the end of the bridge. Runoff is trapped along the right side of the end approach and there is shallow ponding along the right parapet at the end of the bridge (Photo 19). There are no other significant drainage problems on the bridge.	19
TP 349-55	Approach Settlement: There is no settlement at either approach.	
TP 349-57	Approach Pavement: There are new concrete approach slabs. There is a 2.5 feet wide x 2 inch long patch along the begin edge of the end concrete approach slab in the right lane that is cracked and segmented (Photo 20). The asphalt at the transition from the end right concrete approach slab to the asphalt pavement is cracked with several potholes (Photo 21).	20,21
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth. There is surface scaling of the deck longitudinal traction grooving in the center closure pour near mid-span (Photo 22).	22
TP 350-20	Deck - Curbs: There are no curbs on the bridge.	

ITEM	REMARKS	PHOTO NO.
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – There are no sidewalks or safety walks on the bridge. Fascias – There are new concrete single slope parapets on either side of the bridge (Photos 1 & 23).	1,23
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structual Deck: There is a 8.5 inches thick concrete mono-deck. Stay in place forms were used in bays 1, 2, 4, & 5 and the underside of the deck is not visible in those bays (Photo 24). Wood forms were used in bay 3 and the deck is in good condition (Photo 25).	24,25
TP 350-28	Primary Members: The primary members are generally in good condition with no significant section loss noted, except at girder G2. Girder G2 has a 1.25 inch long x 3 inches high rust through hole above the bearing (Photos 26 & 27). The corrosion hole predates the recent painting of the superstructure and there is only minor active corrosion around the perimeter of the hole. There are bearing stiffeners on both sides of the girder located above the bearing. There is no evidence of any web crippling or other distortion of the primary member in the vicinity of the bearing.	26,27
TP 350-29	Secondary Members: The secondary members are in generally good condition. The horizontal diagonal bracing angle from girder G1 gusset plate 3 is bent (Photos 28). A similar condiition exists at girder G3 gusset plate 3. The bends appear to be from impacts that predate the recent painting. There are no tears or other distortions of these angles or the gusset plates noted.	28
TP 350-30	Paint: The paint system is in nearly new condition except for scattered scraps and gouges in the paint surface due to construction demolition of the previous deck (Photo 24 & 29).	24,29
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None visible.	

ITEM	REMARKS	PHOTO NO.
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – Yes · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · Lateral bracing gusset plate connections to all girders.

ITEM 15565.4302M - BRIDGE BEARING RESTORATION (EA)
ITEM 585.01M - STRUCTURAL LIFTING OPERATIONS TYPE A (EA)

BRIDGE BEARING RESTORATION NOTES:

1. BRIDGE BEARING RESTORATION ITEM 15565.4302M SHALL INCLUDE ALL DESIGNATED WORK AS PER THE SPECIFICATION.
2. STRUCTURAL LIFTING SHALL BE USED WITH ALL EXPANSION BEARING RESTORATION.
3. IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER SPAN (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARINGS), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN SPECIFICATIONS SECTON 585-STRUCTURAL LIFTING OPERATIONS.
4. BEARING RESTORATION SHALL AS A MINIMUM, AND IN ALL CASES INCLUDE REPLACEMENT OF BRONZE PLATE.
5. FIXED BEARING TO BE CLEANED IN PLACE. DO NOT DISASSEMBLE.

JACKING NOTES:

THE METHOD OF LIFTING SHALL BE APPROVED BY THE DEPUTY CHEIF ENGINEER (STRUCTURES), DSES, TWO WEEKS PRIOR TO THE START OF THE WORK.

NO LIFTING WILL BE ALLOWED UNTIL ALL TEMPORARY SUPPORTS ARE SECURED.

WHEN POSSIBLE, THERE WILL BE NO LIVE LOAD DURING LIFTING.

LIFTING SHALL BE CONFINED TO ONE END OF A SPAN AT ANY ONE TIME.

IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER PIER (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARING), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN THE SPECIFICATION SECTION 585-STRUCTURAL LIFTING OPERATIONS.

ALL DIMENSIONS ARE IN mm UNLESS OTHERWISE NOTED

B.I.N.: 1093550

Work to be done list:

- Work Zone Traffic Control: Staged
- Deck removal and replacement with cast in place deck with single slope barrier.
- Approach slab removal and replacement with cast in place approach slab
- Joint installation.
- Backwall repair.
- Bearing restoration and structural lifting.
- Install transition railing

Work listed above provides a general overall scope of work for this B.I.N. The order in which work is listed above does not indicate the actual order in which to contractor will proceed. The work to be done list may not include all work in the contract documents.

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1093550
Interstate Route I-481 North Bound
over NYSDOT Maintenance Ramp

Prepared for:

New York State
Department of Transportation

PIN 3056.13.111

LaBella Project No. 201001

August 2001

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D012606, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route I-481 North Bound Bridge over NYSDOT Maintenance Road. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1093550 – Interstate Route I-481 North Bound over NYSDOT Maintenance Road

Type of Material	Estimated Amount
Sheet Packing	6 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route I-481 North Bound Bridge over NYSDOT Maintenance Road. (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by AMA Analytical, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1093550 – Interstate Route I-481 North Bound over NYSDOT Maintenance Road

Sheet Packing

Asbestos-containing sheet packing is located between the top of the abutment and the deck slab at the north end of the bridge only. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 6 square meters. This estimate is based on field measurements taken at the time of the site visit. The approximate location of this asbestos-containing sheet packing is shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Inspection Notes

Carried: 481I 481I33012060 Crossed: W.B.CONN. CheckValue: 1,764,396,296

Note ID: 351110935500000

Beg Abut -- Abutment: Joint with Deck -- Rated 1, Was 6
Referenced Photos: "1", "2"
2011 - The begin joint trough is full of debris and the downspout through the stem (left and right side) is completely plugged. This is allowing the water to saturate the bridge below. The outflow pipe at the bottom of the stem has no water flowing out of it.

Note ID: 351110935500001

Beg Abut -- Abutment: Bearings, Bolts, Pads -- Rated 5, Was 6
End Abut -- Abutment: Bearings, Bolts, Pads -- Rated 3, Was 5
Referenced Photos: "3", "4", "5"
2011 - End bearings 1,3,6 have the left anchor bolts sheared away. Bearings 1 and 3 have a left side plate welded to the bearing. Brg 1 has that bolt sheared away also, but brg 3 still is solid.

The begin right side keeper plate for brg 4 is slightly bent outwards.

Note ID: 351110935500003

Approaches: Settlement -- Rated 4, Was 5
Approaches: Pavement -- Rated 4, Was 4
Referenced Photos: "8"
2011 - The begin pavement is slightly mapcracked. The end pavement is mapcracked and breaking up next to the end of bridge approx. up to 1.5'. This area is depressed and causing tire slapping. The asphalt is also pulling away next to the end of bridge. The end abutment underneath completely saturated, therefore this pavement joint is heavily leaking to below.

Note ID: 351110935500004

Approaches: Erosion -- Rated 4, Was 5
Referenced Photos: "9"
2011 - The end left has an erosion gully at the end of the granite curb runout. The asphalt is sloughing off. The area is approx. 3' wide by 1' deep.

Note ID: 351110935500005

Span 001 -- Deck Elements: Wearing Surface -- Rated 4, Was 5
Referenced Photos: "10"
2011 - The entire wearing surface has several hairline transverse cracks throughout.

Note ID: 351110935500006

Span 001 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Referenced Photos: "11"
2011 - The begin left joint area has a small area of the fascia spalled away, other areas ok.

Inspection Date: 4/26/2011 RC: 33 BIN: 1093550

Inspection Notes

Carried: 481I 481I33012060 Crossed: W.B.CONN. CheckValue: 1,764,396,296

Note ID: 351110935500007

Span 001 -- Superstructure: Structural Deck -- Rated 4, Was 5
Referenced Photos: "12", "13"
2011 - The deck underneath has mapcracks throughout the bays. The worst area is the end left, bay 1, for approx. the last 25'. The deck is delaminated, cracked, and hollow. This area can fall on vehicles below and therefore is being safety flagged.

Note ID: 351110935500009

Span 001 -- Superstructure: Secondary Members -- Rated 5, Was 6
Referenced Photos: "14"
2011 - Just as a reference, one secondary member at the begin left, bay 1, starting from gusset plate 3 on G1, has been bent several years ago. No other significant problems.

Note ID: 351110935500008

Span 001 -- Superstructure: Paint -- Rated 7, Was 3
Referenced Photos: "15"
2011 - The bridge has been painted under conctract D261209.

Note ID: 351110935500002

End Abut -- Wingwalls: Walls -- Rated 4, Was 4
Referenced Photos: "6", "7"
2011 - The end right wingwall is spalled down behind the vertical rebar full height on the inside edge. The spalling is continuing down into the lower portion of the wingwall. The end left lower portion of wingwall is hollow sounding near the stem/wingwall intersection.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: APRIL 3, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093550 (I-481 NB / WB CONN.)

This memorandum summarizes the seismic screening conducted for BIN 1093550 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

ASSIST. TEAM LEADER: T. OLMSTEAD

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	1,2
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are fixed. The steel armor was removed in 2003. There is no joint visible from the top (Photo 1). There is evidence of seepage down the backwall behind girder G5 (Photo 2).	
TP 349-24	Begin Abutment – Bearings: The begin bearing are fixed. The fascia bearings G1 and G5 have pack rust between the rocker and the masonry plate that restricts movement (Photo 3). The right bolt at bearing G5 is loose and tipped (Photo 3). The interior bearings are in good condition and appear to be functioning properly (Photo 4).	3,4
TP 349-26	Begin Abutment - Seat and Pedestals: Seat - The seat is in good condition with no hollow areas or significant cracks detected. Pedestals - The top of pedestal P1 is cracked at the front left and the wraps down the left side (Photo 5). Pedestal P2 is mapcracked and stained at the right rear side (Photo 6). Pedestal P3 is cracked and hollow sounding at the front right corner (Photo 7), and pedestal P4 is cracked at the front right corner and on the right side (Photo 8). The top and right side of pedestal P5 is mapcracked and the top surface has scaling at the left side (Photo 9). See the Begin Abutment Deterioration Sketch.	5,6,7,8,9
TP 349-28	Begin Abutment – Backwall: There are horizontal hairline cracks along the top 2 feet in girder bay 1. At the right side, there is tight map cracking with dampness and efflorescence staining from leakage down the backwall (Photo 2). At the right side there is a 1.5 foot long x 0.5 foot wide spall along the diagonal construction joint (Photo 10). See the Begin Abutment Deterioration Sketch.	2,10
TP 349-30	Begin Abutment – Stem: The stem has been recently repaired with several patched areas. There is a 1 foot wide x 1.5 foot high cracked and hollow area at the top of bay 2 in a recently patched area (Photo 11). See the Begin Abutment Deterioration Sketch.	11
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end joint is steel armored compression seal type (Photo 12). In the right half, there are several areas where there is a gap up to 0.5 inch between the seal and the armor angle (Photo 13). Near the centerline the seal is raised up to level with the armor steel. The concrete headers are in generally good condition with only minor spalling of the concrete at the end edge (Photo 12).	12,13
TP 349-25	End Abutment – Bearings: The end bearings are expansion. The fascia bearings are slightly rusted (Photo 14). The interior bearings are in good condition (Photo 15).	14,15

ITEM	REMARKS	PHOTO NO.
TP 349-27	End Abutment - Seats and Pedestals: The seat is in good condition with no hollow areas or significant cracks detected. The top left edge of pedestal P1 is cracked and hollow sounding. See the End Abutment Deterioration Sketch. The remaining pedestals are in good condition.	
TP 349-29	End Abutment – Backwall: The backwall is hairline cracked throughout (Photo 16). At the end left, the top of the backwall is cracked and there is a two square foot segmented chunk of concrete, and a 3 feet wide x 3.5 feet high x 6 inches deep spall with exposed reinforcement (Photo 17). There are horizontal cracks along the top 2 to 4 inches of the backwall with leakage and staining in bays 1, 2, & 4 (Photos 18, 19, & 16). There is a 4 square foot mapcracked area with efflorescence at the end right backwall (Photo 20). See the End Abutment Deterioration Sketch.	16,17,18 19,20
TP 349-31	End Abutment – Stem: There is a full height vertical hairline crack left of pedestal P3 and scattered hairline cracks below bay 4 and at the left side. See the End Abutment Deterioration Sketch.	
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: At the begin right approach, the approach pavement at the curbline is slightly higher than the top of deck trapping runoff and causing shallow ponding along the curbine of the deck at that location (Photo 21). There is leakage down the begin right backwall (Photo 2).	2,21
TP 349-55	Approach - Settlement: There is no significant settlement at either approach.	
TP 349-57	Approach - Pavement: At both approaches, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with up to 2 inches wide x up to 1.5 inches deep potholes along the concrete headers (Photos 1 & 12).	1,12
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth. There is some minor wear of the transverse grooving in the wheel paths of the left lane.	
TP 350-20	Deck - Curbs: The curbs are granite in good condition. Left average curb reveal is 8.5 inches and the average right curb reveal is 9 inches.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – Both safety walks have light mapcracking throughout and there are scattered small spalls along the curb (Photo 22). No hollow sounding areas were detected.	22

ITEM	REMARKS	PHOTO NO.
	Fascias – Left - The upper (safety walk) portion and the lower (deck) portion of the left fascia are tight mapcracked throughout (Photo 23). There is a spall of the upper portion at the begin (Photo 24). The lower portion has several spalled and hollow sounding areas. Significant areas are noted below:	23,24
	o A horizontal crack just below the upper portion of the fascia over 50% of the span length. Most of this crack is tight with some efflorescence, however, a +/- 20 long section near mid-span is spalled along the crack up to 2 inches high x 2 inches deep with staining (Photo 25);	25
	o A 1 square foot hollow sounding area with horizontal cracking under the 2nd railing post (Photo 26);	26
	o A 1 square foot spall with exposed reinforcement and staining near the 3rd railing post (Photo 23);	23
	o A 3 feet long horizontal crack with shallow spalling near the end (Photo 27); and	27
	o A 1 square foot spall along the bottom edge near the end (Photo 27).	27
	Right - The upper (safety walk) portion of the right fascia is mapcracked with light efflorescence throughout (Photo 28). The lower portion has several spalled and hollow sounding areas. Significant areas are noted below:	28
	o A 2 square foot spall up to 2 inches deep with exposed reinforcement and staining near the begin (Photos 29 & 30);	29,30
	o A 1 square foot x 1 inch deep spall with staining beneath the 1st railing bay (Photos 29 & 31);	29,31
	o A 2 square foot hollow sounding area with horizontal cracking under the 2nd railing post (Photo 31);	31
	o A horizontal crack with staining and a 1 foot long x 2 inches high x 1 inch deep spall near mid-span (Photo 28);	28
	o A horizontal crack with efflorescence just beneath the upper portion of the fascia for an estimated 30% of the fascia in the middle half of the span (Photo 28). Most of this crack is tight with some efflorescence, however, a +/- 12 feet long section near 2/3 span is spalled along the crack up to 2 inches high x 2 inches deep with staining (Photo 32); and	28,32
	o Several horizontal cracks with scattered spalls along the cracks in the end ¼ of the span (Photo 33).	33
TP 350-22	Deck - Railings: The railings on both sides of the bridge have failure of the galvanized surface with surface rusting of the top and sides of both rails (Photo 34). The rails are more severely rusted near the rail splices with several rust through holes on the side and bottom surfaces (Photos 35 & 36). There is chain link snow fence in good condition attached to the left and right railings above the Rt. 290 roadway below.	34,35,36
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono-deck. SIP forms were not used. Records indicate the deck was repaired, the surface was scarified and received a 1.75 inch concrete overlay in 1987.	

ITEM	REMARKS	PHOTO NO.
	Top of Deck - There is scattered random cracking throughout with scattered hollow areas (Photo 37) as illustrated in the Top of Deck Deterioration Sketch. The cracking is worst toward the end half of the span with longitudinal, transverse, and diagonal cracks up to 1/8 inch wide (Photos 38 & 39). The total hollow area is 1.5%.	37,38,39
	Underdeck – There is widespread hairline cracking of the underside of the deck throughout (Photo 40). There are scattered more pronounced cracks, some with efflorescence. There are delaminated, hollow sounding, and damp areas; and spalls, some with exposed rusted reinforcing bars. The deteriorated areas are illustrated on the Under Deck Deterioration Sketch. The more significant areas are noted below: o Bay 1 near diaphragm 4 – 10 square foot area of hollow sounding concrete. o Bay 1 near the end of diaphragm bay 5 – 25 square foot area of hollow sounding concrete.	40
	o Bay 3 in diaphragm bay 4 – 2 square foot area cracking and hollow sounding concrete and a 3 square foot spall with efflorescence and exposed reinforcement (Photo 41).	41
	o Bay 4 at diaphragm 5 – 10 square foot area of hollow sounding concrete and a 2 square foot spalled area with exposed reinforcement (Photo 42).	42
	o Bay 4 near the end – 10 square foot area of hollow sounding and delaminated concrete with spalling along the edges (Photo 43).	43
	o Bay 4 at the end right – 3 square foot hollow sounding area with surface scaling and light efflorescence (Photo 44).	44
TP 350-28	Primary Members: Good condition; surface rusting where the paint has peeled or blistered. There is no significant section loss noted.	
TP 350-29	Secondary Members: Good condition; surface rusting where the paint has peeled or blistered.	
TP 350-30	Paint: The paint system is failed on 10% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges and scattered locations on the girder webs and secondary members (Photos 45 & 46). There is surface rusting where the paint has peeled or blistered. The outside web of the right fascia girder G5 has blistering and peeling paint over 15% of the surface (Photo 47).	45,46,47
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: There are overhead wires attached to the bottom flanges of both fascia girders at the end (Photo 48).	48

ITEM	REMARKS	PHOTO NO.
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required Non-Redundant/Fracture Critical Members – No Pin and Hangers – No Fatigue-Prone Welds – No Non-Categorized Fatigue-Prone Details – No Other – No Special Emphasis Details No Special emphasis details.

PROJECT LOCATION

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481I-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481I-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

DECK REPAIR NOTES:

THIS LOCATION IS CURRENTLY FILLED WITH ASPHALT (BLACKTOP). DEPTH OF ASPHALT IS UNKNOWN, ESTIMATED AT @ 36mm. THE REMOVAL OF THE ASPHALT AND CONCRETE TO LIMITS SHOWN TO BE PAID UNDER ITEM 579.02M.

REMOVE CONCRETE TO LIMITS SHOWN AND TO SOUND CONCRETE AS ORDER BY ENGINEER.

THE AREA THAT IS REPAIRED SHALL ALSO RECEIVE:

ITEM 558.01M - TRANSVERSE SAWCUT GROOVING
ITEM 18559.1896M - PROTECTIVE SEALING

THE AREA SHOWN IS THE RESULT OF FIELD INVESTIGATION AND IS AN APPROXIMATE AREA. THE ACTUAL LIMITS SHALL BE AS DIRECTED BY ENGINEER.

NO FULL DEPTH SLAB REPAIR IS EXPECTED AT THIS LOCATION.

REFER TO DRAWING NO. GN-1 FOR SERIALIZED ITEM NOTES.

GENERAL NOTES:

SEE DWG. GP16-1 FOR WORK TO BE DONE ON BIN 1093561.

"MAC" JOINT IS A MODIFIED ARMORED JOINT SYSTEM WITH COMPRESSION SEAL.

UTILITIES BELONGING TO 'NEWCHANNEL CORP.' AND ELECTRIC UTILITIES IN VICINITY OF THESE STRUCTURES. SEE INFORMATION AVAILABLE TO BIDDERS FOR ADDITIONAL DETAILS.

WORK TO BE DONE ON BIN 1093562- (NOT NECESSARILY IN THIS ORDER)

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION.
2. REMOVE EXISTING BRIDGE JOINT, END ABUTMENT (NORTH), TO INCLUDE REMOVAL OF THE ARMORING DECK ANGLE.
3. REMOVE EXISTING ARMORING DECK ANGLE AT BEGINNING ABUTMENT, (SOUTH).
4. INSTALL PROPOSED BRIDGE JOINT AT END ABUTMENT, ("MAC" JOINT).
5. REPAIR DECK AREA AT BEGINNING ABUTMENT WHERE THE ARMORING DECK ANGLE WAS REMOVED.
6. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES.
7. PERFORM MISCELLANEOUS REPAIRS TO CONCRETE ELEMENTS AT BOTH ABUTMENTS.
8. REMOVE EXISTING BRIDGE DECK ASPHALT PATCH.
9. PLACE NEW CONCRETE BRIDGE DECK PATCH.

ITEMS USED:

ITEM 558.01M - TRANSVERSE SAWCUT GROOVING (SM)
ITEM 18559.1896M - PROTECTIVE SEALING FOR STRUCT. CONC. (SM)
ITEM 578.020005M - OVERLAY CONCRETE, CLASS "E" (SM)
ITEM 578.030005M - SLAB RECONSTRUCTION CONCRETE, CLASS "D" OR "E" (SM)
ITEM 579.02M - REINFORCING BAR EXPOSURE (SM)

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 South Bound bridge over Route 290. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-09356-1 Interstate Route 481 South Bound over Route 290

Type of Material	Estimated Amount
Sheet Packing	8.1 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 South Bound bridge over Route 290 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09356-1 Interstate Route 481 South Bound over Route 290

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 8.1 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 20, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093561 (I-481 SB / RT 290)

This memorandum summarizes the seismic screening conducted for BIN 1093561 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 1.8% of the top and 1.5% of the underside of the deck area. The cores indicate the reinforcement steel is 4.0 inches below the surface of the deck. The lab test indicate that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is mostly damaged and will require reconstruction. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Damaged areas at the underside of the deck will require full depth reconstruction. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. Reinforcement with significant section loss will be replaced. Partial and full depth removal areas will be reconstructed to adjacent grade. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove the portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is damaged and will require reconstruction. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6.25 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $468,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $532,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

INTRODUCTION

a. Bridge History
   i. Year Built: 1972
   ii. Bridge Type: Single Span, Steel Multi-girder
   iii. Span Length: 111 feet
   iv. Out-to-Out Width: 54 feet
   v. Structural Ratings and Rankings
      1. Federal Sufficiency: 87.4 (Apr. 2012)
      2. Condition Rating: 5.031 (Apr. 2012)
      3. General Recommendation: 5 (Apr. 2012)
   vi. Live Load Posting (HS25): No
   vii. National Highway System (NHS): Yes
   viii. Previous work Done:
      1987 – Replace wearing surface (asphalt concrete overlay) with concrete overlay
      1992 – Clean and paint metal surfaces
      1999 – Asbestos testing
      1999 – Waterproofing bridge deck and corrosion inhibitor
      2003 - Remove begin armor angle and replace with concrete header
      - Replace end ACJ
      - Misc.repair of concrete deck
      - Misc.repair of concrete at abutments
      2004 – Asbestos testing
   ix. Planned Future Work: N/A

b. Highway Classification

i. Functional Classification: Urban Principle Arterial - Interstate

ii. Traffic Volumes

YEAR	PROJECTED AADT
2014	25226
2034	37485
2054	55700

iii. Plan for Maintenance and Protection of Traffic:
Maintenance and Protection of traffic will be achieved by staged construction.

ITEM	REMARKS	PHOTO NO.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: Top of deck items were not inspected.	
TP 349-24	Begin Abutment – Bearings: The begin bearing are fixed. The fascia bearings G1 and G6 have pack rust between the rocker and the masonry plate that restricts movement (Photos 1 & 2). The left and right bolts at bearing G6 are in place but sound dull when struck and are likely detached (Photo 2). The interior bearings are in good condition and appear to be functioning properly.	1,2
TP 349-26	Begin Abutment - Seat and Pedestals: Seat - The seat is in good condition with no hollow areas or significant cracks detected. Pedestals - The top of pedestal P1 is cracked and has a 0.5 square foot of hollow sounding concrete at the left rear (Photo 3). The crack wraps down the left side and there is spalling up to 1.5 inches deep along the crack. The left side is mapcracked with light efflorescence. Pedestal P6 is cracked and has a 0.5 square foot spall at the top right rear (Photo 4). See the Begin Abutment Deterioration Sketch.	3,4
TP 349-28	Begin Abutment – Backwall: There is tight mapcracking throughout the backwall. In bay 3, there are more pronounced mapcracks with efflorescence and a 6 square foot area of scaling of the concrete surface (Photo 5). The top of the right side is mapcracking with dampness and efflorescence staining from leakage down the backwall and there is a one square foot spall along the diagonal deck haunch joint (Photo 6). At the bottom right, there is 0.5 square foot area of dampness and spalled concrete above pedestal P6 (Photo 4). See the Begin Abutment Deterioration Sketch.	4,5,6
TP 349-30	Begin Abutment – Stem: The stem has been recently repaired with several patched areas. The left and right sides have tight mapcracking (Photo 7). See the Begin Abutment Deterioration Sketch.	7
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: Top of deck items were not inspected.	
TP 349-25	End Abutment – Bearings: The end bearings are expansion. The fascia bearings are slightly rusted (Photos 8 & 9). The interior bearings are in better condition. All of the bearings are extended at 40 ºF (Photos 9 & 10) and may not be functioning properly.	8,9,10
TP 349-27	End Abutment - Seats and Pedestals: Seat - The seat is in good condition with no hollow areas or significant cracks detected.	

ITEM	REMARKS	PHOTO NO.
	Pedestals - The top of pedestal P1 is cracked at the left side (Photo 8). The crack wraps down the left side. See the End Abutment Deterioration Sketch. The remaining pedestals are in good condition with no significant cracks or hollow areas detected.	8
TP 349-29	End Abutment – Backwall: The backwall is tight hairline cracked over approximately 30% of the surface. At the end left, the top of the backwall is cracked with efflorescence along the edges of a patch and there is a 0.5 square foot x 6 inches deep spall at the deck haunch (Photo 11). There is a 4 square foot mapcracked area with efflorescence at the end right backwall (Photo 12). See the End Abutment Deterioration Sketch.	11,12
TP 349-31	End Abutment – Stem: The stem is tight hairline cracked over approximately 30% of the surface (Photo 13). There are scattered more pronounced hairline cracks. See the End Abutment Deterioration Sketch.	13
	APPROACH ITEMS	
TP 349-53	Approach - Drainage: Top of deck items were not inspected.	
TP 349-55	Approach - Settlement: Top of deck items were not inspected.	
TP 349-57	Approach - Pavement: Top of deck items were not inspected.	
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: Top of deck items were not inspected.	
TP 350-20	Deck - Curbs: Top of deck items were not inspected.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – The safety walks on both sides are tight mapcracked throughout. At the left, in the 4th railing bay from the end, there is cracking along the outside edge and a 1.5 feet long x 3 inches wide x 1.5 inches deep spall with damp crumbly concrete (Photo 14). At the right, in the 3rd railing bay from the end, there is a 4 square foot area of cracked and spalled concrete (Photo 15).	14,15
	Fascias – At both fascias, the upper (safety walk) portion and the lower (deck) portion of the fascias are tight mapcracked throughout with the most pronounced areas below the railing posts (Photo 16). There are no significant cracks or hollow sounding areas noted.	16
TP 350-22	Deck - Railings: Top of deck items were not inspected.	

ITEM	REMARKS	PHOTO NO.
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structural Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono-deck. SIP forms were not used. Records indicate the deck was repaired, the surface was scarified and it received a 1.75 inch concrete overlay in 1987. Top of Deck - Top of deck was not inspected. Underdeck – There is widespread hairline cracking of the underside of the deck throughout. There are scattered more pronounced cracks, some with efflorescence. There are delaminated, hollow sounding, and damp areas; and spalls, some with exposed rusted reinforcing bars. The deteriorated areas are illustrated on the Under Deck Deterioration Sketch. The more significant areas are noted below: o Fascia bays on both sides have scattered locations with cracking and staining where the deck reinforcement chairs are located (Photo 17). o Bay 2 at the end right – 8 square foot area of hollow sounding concrete. o Bay 3 at the end – 30 square foot area of cracking, efflorescence, and hollow sounding concrete. o Bay 4 in diaphragm bay 5 – two 3 square foot areas of hollow sounding concrete (Photo 18). o Bay 4 at the end – 75 square foot area of cracking, efflorescence, hollow sounding and delaminated concrete (Photo 19). o Bay 5 at the end – 12 square foot hollow sounding area with surface scaling and light efflorescence (Photo 20).	17 18 19 20
TP 350-28	Primary Members: Good condition; surface rusting where the paint has peeled or blistered. There is no significant section loss noted.	
TP 350-29	Secondary Members: Good condition; surface rusting where the paint has peeled or blistered (Photos 21, 22, & 23). There is no significant section loss noted.	21,22,23
TP 350-30	Paint: The paint system is failed on 15% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges and scattered locations on the girder webs and secondary members (Photo 21). The outside surfaces of the fascia girders are the worst with blistering and peeling paint over 10% of the surfaces of the webs and 30% of the bottom flanges (Photos 22 & 23). The bottom flanges of the interior girders also have 30% blistering and peeling paint (Photo 24). There is surface rusting where the paint has peeled or blistered.	21,22,23 24

ITEM	REMARKS	PHOTO NO.
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: There are overhead wires attached to the bottom flanges of both fascia girders at the end (Photo 13).	13

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 North Bound bridge over Route 290. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-09356-2 Interstate Route 481 North Bound over Route 290

Type of Material	Estimated Amount
Sheet Packing	10.4 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 North Bound bridge over Route 290 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09356-2 Interstate Route 481 North Bound over Route 290

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 10.4 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 26, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093562 (I-481 NB / RT 290)

This memorandum summarizes the seismic screening conducted for BIN 1093562 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

REMARKS

GENERAL NOTE

Popli Design Group performed an In-depth Inspection of the I-481 Southbound bridge over Conrail - BIN 3/3 1093571. The field work began of 3/17/2014 and was completed on 3/27/2014. The inspection teams and their respective elements inspected are as follows:

Inspection team of A. Thompson, P.E. - Team Leader; and M. Savino – Assistant Team Leader

- underside elements:
  - piers 2, 4, 6, 8 thru 10
  - superstructure span 2 thru span 10
  - fascias span 1 thru span 15

Inspection team of G. Stam, P.E. – Team Leader; and T. Olmstead – Assistant Team Leader

- topside elements:
  - begin abutment
  - deck span 1 thru span15
  - superstructure span 1 thru span 15
  - end abutment
- approach pavement and drainage near the bridge
- underside elements:
  - begin abutment
  - piers 1, 3, 5, 7, and 11 thru 14
  - superstructure span 1, and span 11 thru span 15
  - end abutment

BEGIN ABUTMENT ITEMS

Begin Abutment - Joint with Deck:
The begin bearings are expansion. The begin joint is steel armored compression seal type in generally good condition (Photo 1). The steel armor plate is lightly rusted. The begin concrete header is cracked and spalled 4 feet long x 3 inches wide x 1 inch deep near the centerline. The seal is partially filled with sand and roadway debris. There is seepage staining down the backwall in girder bay 3, however, the backwall is dry and the joint seal appears to be functioning (Photo 2).

Begin Abutment – Bearings:
The begin bearings are expansion. The fascia bearings are moderately rusted and movement is likely restricted (Photo 3). The interior bearings are in better condition. The bearings are high rocker bearings and all the bearings are in a normal slightly constricted position at 6° F (Photo 4).

Begin Abutment - Seat and Pedestals:
There are stub abutments, therefore no seat. The right front corner and right side of pedestal P3 is cracked and hollow sounding (Photo 5). The remaining pedestals are in good condition with no significant cracks or hollow areas detected.

Begin Abutment – Backwall:
There is seepage staining down the backwall with tight mapcracking in girder bay 3 and the right fascia bay (Photos 2 & 6).

Begin Abutment – Stem:
There are stub abutments, therefore no stem.

REMARKS

END ABUTMENT ITEMS

End Abutment - Joint with Deck:
The end bearings are fixed. The steel armor angle was removed and replaced with a concrete pavement transition header. At the top, there is no joint visible (Photo 7).

End Abutment – Bearings:
The end bearing are fixed and in generally good condition.

End Abutment - Seats and Pedestals:
There are stub abutments, therefore no seat. The left side of the top of Pedestal P1 is hairline ctacked (Photo 8). The remaining pedestals are in good condition with no significant cracks or hollow areas detected.

End Abutment – Backwall:
There is scattered tight hairline cracking with efflorescence throughout. The upper left corner in the left fascia bay has 2 square feet of hairline cracking with light efflorescence (Photo 9). The bottom half of the backwall in bay 1 has scattered less than 1 inch deep surface pop-outs (Photo 10). In bay 2, there are several full height vertical hairline cracks. At the right side of bay 2, there is a full height crack with efflorescence and staining (Photo 11). At the right cheek wall and bottom of the right fascia bay, there is an 8 inches wide x 2 feet high x up to 6 inches deep spall with damp crumbly concrete and exposed rusted reinforcement (Photo 12). To the right and below the spall, there is a 2 square foot area of hollow sounding concrete.

End Abutment – Stem:
There are stub abutments, therefore no stem.

APPROACH ITEMS

Approach Drainage:
At the begin right, the asphalt pavement along the shoulder is slightly higher than the deck. There is evidence of shallow ponding along the right curbline at the begin joint with deck (Photo 13). There is evidence of seepage down the begin abutment backwall at the right side (Photo 6). At the end right approach, there is gravel build-up along the shoulder that traps run-off and there is evidence of shallow ponding along the curbline at the pavement transition (Photo 14). There is seepage down the end right backwall (Photo 12).

Approach Settlement:
There is no significant settlement at either approach.

Approach Pavement:
At both approaches, the asphalt pavement adjacent to the bridge is transverse cracked along the pavement transitions. (Photos 7 & 1).

DECK ITEMS

Deck - Wearing Surface:
The ride quality of the deck is smooth. There is moderate wear of the transverse sawcut traction grooving of the deck in the wheel paths (Photo 15).

Deck - Curbs:
There are sloped face granite curbs imbedded in the single sloped concrete parapets. Generally, the curbs are in good condition. There are scattered locations where there is loose or missing mortar at the curb joints (Photo 16).

The original curb reveal was installed at 15.5 inches reveal. The average curb reveal for each side in each span is as follows:

REMARKS

CURB REVEAL by SPAN		
Span No.	Left Curb Reveal (inches)	Right Curb Reveal (inches)
1	13.75	13.5
2	13.5	13.75
3	13.5	13.5
4	13.5	13.75
5	14.0	13.5
6	13.5	13.5
7	13.5	13.5
8	13.0	13.75
9	13.5	13.5
10	13.75	13.5
11	13.75	13.5
12	13.75	13.75
13	13.75	13.5
14	13.75	13.5
15	13.75	13.75

Deck – Sidewalks and Fascias:
Sidewalks – There are no sidewalks or safety walks on the bridge.

Fascias –
Both fascias in all spans have scattered hairline cracking and staining throughout (Photo 17). There are scattered locations of cracks, staining, delaminations and spalls (Photo 18). Significant locations are noted below:

Span 4 right fascia – at the begin above pier 3, the concrete is severely deteriorated with spalling up to 6 inches deep and crumbly concrete (Photo 19).

Span 5 right side – at the end near pier 5, there is hairline cracking, staining and a 0.5 square foot x 1 inch deep spall.

Deck – Railings and Parapets:
Railings - There are 12 inches high aluminum railings anchored to the top of the concrete parapets (Photo 33). Generally, the railings are in good condition.

Parapets - In 2003, the concrete parapets received partial concrete repairs primarily to the top and top half of the inside face. The parapets exhibit extensive horizontal cracking and scattered locations of staining of the inside faces at 3 inches to 6 inches below the top of the parapet (Photos 20 & 21); and in areas surrounding previous repairs (Photo 22). The outside faces are also typically cracked with scattered locations of staining (Photos 23 & 24).

There are scattered areas of more extensive cracking, delamination and spalling with exposed reinforcement as noted below:

Span 3 right @ begin – an 8 inches long x 12 inches high x 2 inches deep spall at the span 2 joint (Photo 25).

Span 4 left @ mid-span – a +/-30 feet long area with severe cracking and spalled along the outside top edge with exposed rusted reinforcement (Photo 26); and severe cracking and delamination on the inside top edge(Photo 27).

Span 5 left ¼ span – spalled along the outside top edge exposed rusted reinforcement (Photo 28).

Span 5 left 2/3 span – spalled along the inside top at railing post. There is minor staining of the concrete, but the railing post anchors are not exposed. (Photo 29).

Span 5 right 1/3 span – spalled along the outside top edge with exposed rusted reinforcement (Photo 30).

Span 5 right 2/3 span – spalled along the outside top edge.

Span 6 left @ begin ¼ span – area of heavy cracking along the top edge. There is a 30 feet long section

REMARKS

with severe cracking and crumbly concrete and a 5 feet long section of spalling with exposed reinforcement (Photo 31).
Span 7 left @ 1/4 span - spalled along the inside top at railing post. There is minor staining of the concrete, but the railing post anchors are not exposed. (Photo 32).
Span 8 left @ ¼ span – cracked, stained and delaminated along the inside and outside faces (Photos 33 & 34).
Span 8 left @ mid-span - spalled along the outside top edge with exposed reinforcement (Photo 35).
Span 8 right @ mid-span - spalled along the outside top edge with exposed reinforcement (Photo 36).
Span 10 left @ end – cracked, stained and delaminated with efflorescence along the outside and inside faces (Photos 37 & 38).
Span 13 left @ mid-span – cracked, stained and delaminated with efflorescence along the outside face (Photo 39).

SUPERSTRUCTURE ITEMS

Structural Deck:
Record plans indicate the original structural deck is 8 inches thick concrete mono-deck. SIP forms were used. Records indicate the deck was repaired, the surface was scarified and it received a 1.5 inch minimum concrete overlay in 1987. Curb reveal measurement would indicate a nominal existing deck thickness of 9.75 inches to 10 inches.

Top of Deck - There is scattered random cracking with hollow areas throughout as illustrated in the Top of Deck Deterioration Sketch. The total hollow and spalled area; and percent of deteriorated span surface are noted in the table below:

DECK DETERIORATION QUANTITIES		
Span No.	Deteriorated Area (square foot)	Percent of Deteriorated Area
1	446.75	15.5
2	303.5	5.7
3	97.5	1.7
4	132.5	2.0
5	426.0	6.3
6	277.0	4.1
7	271.0	6.4
8	105.5	2.5
9	64.0	1.5
10	203.5	4.8
11	118.5	2.8
12	64.5	1.5
13	92.75	2.2
14	190.5	4.5
15	56.0	1.3
Total	2849.5	4.0

Significant locations of deterioration are noted below:
Span 1 left lane – severely cracked in the begin and end ¼ spans.
Span 1 right lane – Severely cracked with hollow areas at mid-span and end 1/3 span (Photo 40).
Span 2 left lane - severely cracked in the end ¼ span.
Span 2 right lane - tight mapcracking throughout. The worst is at 2/3 span and near the end 1/4 span.
Span 3 right lane – tight mapcracking throughout (Photo 41). Heavy cracking and hollow areas near ¼

REMARKS

span and mid-span (Photo 42).
Span 4 right lane – heavy cracking and hollow area near mid-span.
Span 5 left lane – severe longitudinal cracking with hollow areas in the middle ½ span (Photo 43).
Span 6 left lane – severe cracking with hollow areas in the begin 2/3 span.
Span 7 right lane – cracking throughout. Worst is in the begin 1/2 span with extensive hollow area.
Span 8 left lane – heavily cracked throughout with scattered hollow areas (Photo 44).
Span 9 left lane – moderately cracked throughout. The begin ½ span near the right wheel path is heavily hairline cracked (Photo 45).
Span 9 right lane – heavily cracked in the begin 1/3 span.
Span 10 left lane – heavily cracked near the end of the span.
Span 10 right lane – moderate cracking throughout.
Span 11 right lane – moderate cracking throughout.
Span 12 left lane – a 2 square foot severely cracked area with segmented chunks at the begin in the right wheel path (Photo 46). Heavily cracked in the end ¼ span (Photo 47).
Span 13 right lane – severely cracked with hollow areas in the begin ½ span.
Span 14 left lane – extensive transverse and longitudinal cracking with scattered hollow areas near mid-span (Photos 48 & 49)
Span 14 right lane – cracking and hollow areas near ¼ span and end of the span.
Span 15 left lane – severe mapcracking and hollow areas near end. (Photo 50).
Span 15 right lane – scattered longitudinal cracks and hollow areas throughout.

Underdeck – There are stay-in-place forms at the underside of the deck throughout (Photo 51). Typically, at the ends of the deck at the joints there is rusting of the SIP's indicating leakage of the joints or seeping at the headers (Photo 52). Typically in each span, there is a 2.5 feet length of SIP that had been removed for inspection at the time of construction. The exposed deck and surrounding forms in these areas were in good condition.

Primary Members:
Generally, the primary members are in good condition with only surface rusting where the paint has blistered or peeled. More extensive peeling and blistering of the paint; and localized corrosion of the steel at the girder ends is evident near leaky superstructure joints. There were no warping, crushing or other distortions of the primary members evident at heavily corroded locations above the bearings. Significant corrosion locations are noted below:

Span 3 girder G4 at end - the bottom right side of the web and right stiffener in a 3 inches high band above the bottom flange above the bearing. Section loss is estimated at less than 5% (Photo 53). There are no significant section loss of the inside bearing stiffener.
Span 5 girder G1 at end – the bottom right side of the web in a 3 inches high band above the bottom flange above the bearing. The corrosion is concentrated at the begin side of the bearing stiffener (Photos 54 & 55). Section loss readings taken by "D" meter show up to 50% percent localized section loss in the 3 inch high band. There are no significant section losses of the bearing stiffeners, or the web on the end side of the stiffener. Total section loss is 5% of the web and stiffeners section above the bearing.
Span 6 girder G4 at begin - the bottom outside (right) bearing stiffener (Photo 56). The section loss of the stiffener is estimated at less than 5%. There are no significant section losses of the web or inside bearing stiffener.
Span 14 girder G1 at end - the bottom outside (left) bearing stiffener (Photo 57). The section loss of the stiffener is estimated at less than 5%. There are no significant section losses of the web or inside bearing stiffener.
Span 15 girder G1 at begin - the bottom outside (left) bearing stiffener (Photos 57 & 58). The section loss of the stiffener is estimated at less than 10%. There are no significant section losses of the web or inside bearing stiffener.
Span 15 girder G4 at begin - the bottom outside (right) web and bearing stiffener (Photos 59, 60, 61, & 62). Section loss readings taken by "D" meter and caliper show 37% percent localized section loss of the web and outside stiffener in a 3 inch high band of corrosion above the bottom flange. There are no significant section loss of the inside bearing stiffener. Total section loss is 15% of the web and stiffeners

REMARKS

section above the bearing.

Secondary Members:
Generally, the secondary members are in good condition with only surface rusting where the paint has blistered or peeled. More extensive peeling and blistering of the paint; and corrosion of the secondary member steel has occurred near leaky superstructure joints. Significant locations are noted below:

Span 2 at begin girder bay 1 – lower begin right diagonal gusset plate is heavily corroded with +/- 50% maximum section loss (Photo 63).

Span 2 at end and Span 3 at begin – gusset plates for bottom laterals have +/-67% maximum section loss with no rust-thru holes (Photo 64).

Span 3 at end girder bay 1 – lower end left “k”-bracing gusset plate is heavily corroded with a 1.5 inch diameter rust thru hole (Photo 65).

Span 4 at end and span 5 at begin – gusset plates for bottom laterals have +/-50% maximum section loss with no rust-thru holes (Photo 66).

Span 7 – bay 2 begin diaphragm – bottom chord angle deflected toward end 4” (Photo 67). Connections to the girders are intact.

Paint:
The paint system is failed on 10% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges and scattered locations on the girder webs (Photo 68). The top of the outside bottom flanges are worst with 50% of the surface having blistered and peeling paint (Photo 69). There is 50% to 100% paint failure on end diaphragms and diaphragm gusset plates where leaky joints exist (Photo 70). There is surface rusting where the paint has peeled or blistered.

Joints:
There are three types of pier joints on the bridge. Spans 1, 2, 3, 4, 5, & 9 are either 2.5 inch wide, or 11 inches x 6 inches wide steel angle armored open joints with below deck gutter system. Spans 6, 7, 8, 10, 11, 12, 13, 14 are 1 inch wide steel angle armored compression seal joints. All joints appeared in generally good condition from above. Spans 1, 2, & 9 joints have elastomeric concrete headers. The span 1 end side header in the right lane is cracked and segmented 2 feet wide x full width in the left wheel path and cracked in the right wheel path (Photo 71). The span 9 header is cracked near the centerline and in the right lane (Photo 72). The below deck joint gutters in Spans 1, 2, 3, and 9 are filled with debris (Photos 73 & 74). The supports for the gutters have rust with minor section loss but are functioning properly (Photo 70). The hopper of the left side gutter and downspout system at span 5 joint is corroded and leaking on the substructure element below (Photos 75 & 76). Typically, the steel angles and plates on the underside of the joints are heavily rusted with section loss and holes (Photo 73 and 74). The joints in Spans 3, 5, 6, 7, 8, and 10 thru 14 have their steel angles rusted away underneath exposing the underside of the headers which are moderately to heavily spalled throughout their lengths (Photos 74 & 77).

PIER ITEMS

Pier Bearings:
The begin row of bearings on each pier is fixed, and the end row is expansion. Typically, the bearings have peeling and blistering paint with light to heavy corrosion (Photo 78). The bearings on piers 1 thru 3 and 6 thru 14 are high rockers. The typical condition is light to heavy pack rust with contracted rockers; except the rockers at pier 14 were extended or neutral at 35° F. Specific conditions are noted as follows:

REMARKS

PIER HIGH ROCKER BEARING DATA

Pier No.	Bearing	Temp. (° F)	Tilt Angle (Degrees)	Tilt Direction	Rocker Displacement (Inch)	Rocker Displacement Direction	"X" Dimension (min. dist. between girders)	Photo No.

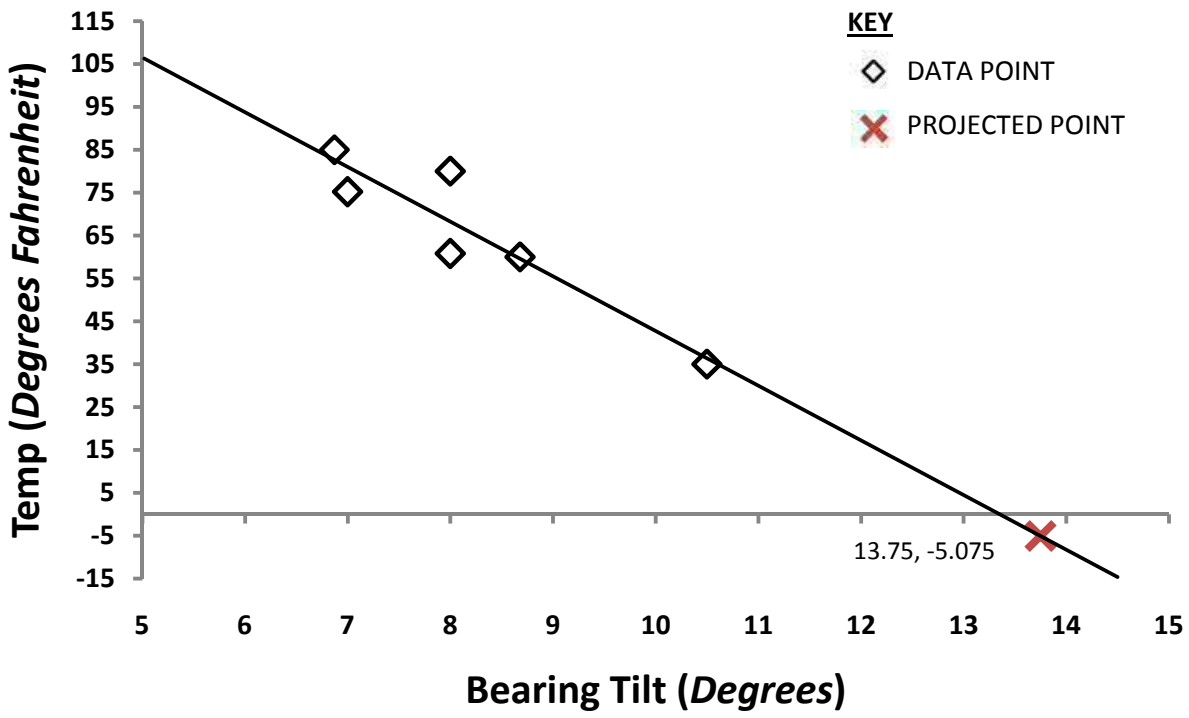
10	B3	35	Not Taken		0.25	End	Not Taken	
10	B4	35	Not Taken		0.19	End	Not Taken	
11	B1	35	10.5	Contracted	None		9.75	87
14	B4	35	5.5	Extended	1	End	7.375	88

The bearing with the worst tilt condition was at Pier 11 expansion bearing B1. The linear regression of the historical readings taken at this bearing is shown on Figure 1. The allowable angle of tilt is 13.75° given the rocker should bear on the masonry plate within the middle 50% of the arch of the rocker. Figure 1 indicates that the tilt would exceed the maximum allowable tilt of the rocker at approximately -5° F. This is a serious condition and warrants further investigation and analysis.

REMARKS

Figure 1 - Bearing Tilt - Pier 11 Bearing G1



The pier 14 expansion bearings B1 and B4 were extended at 35° F which is an abnormal condition (Photos 89 & 88). The interior bearings B2 and B3 were in a neutral position at 35° F. Additionally, the rocker at bearing B4 is displaced endward by 1 inch indicating the bearing is frozen and the rocker is "walking" during contraction rather than rotating or rocking. Several other rockers were displaced less severely throughout the bridge. Displacement measurements were recorded at Piers 6, 8, 9, 10, and 14.

Additionally, at the pier 14 fixed bearing B1, there is heavy corrosion on the outside of the end left side wing plate (Photo 90). Section loss measurements taken by caliper indicated 60% section loss along a band of corrosion 2 inches above the masonry plate. There was no warping, crushing or other distortion of the wing plate evident.

The bearings at pier 4 and pier 5 are multi-rotational disk bearing type. No splitting, tearing, or abnormal bulges of the disks were observed. The expansion bearings have polytetrafluoroethylene (PTFE) sliders with polished stainless steel plate surfaces. All of the bearings were in a normally contracted position at 40° F. At pier 5, the stainless steel plates were slightly clouded and streaked with a thin film of dirt on the plates visible where the bearing had contracted (Photos 91 & 92).

Pier – Pedestals:
The pedestals had locations of cracked, hollow, and spalled concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

Pier 1 pedestal P1 – cracked along the top left side and spalled 6 inches high x 2 feet long x 2 inches deep with exposed reinforcement that is mostly bonded (Photo 93).
Pier 1 pedestal P2 – begin right face and corner cracked with 2 square foot area of hollowness (Photo 94).
Pier 1 pedestal P3 – begin right face 3 square foot area of hollowness (Photo 95).
Pier 3 pedestal P1 – begin left face cracked with 2 square foot area of hollowness; and an 18 inches wide

REMARKS

x 6 inches high x 1.5 inches deep spall with staining and exposed reinforcement (Photo 96).

- Pier 3 pedestal P2 – top of the begin face has 2 square foot area of hollowness (Photo 97); and 4 square foot of hollowness at the end face (Photo 98).
- Pier 3 pedestal P3 – right side cracked (Photo 99).
- Pier 3 pedestal P4 – left side cracked (Photo 100); and the top of the begin face is spalled 32 inches wide x 18 inches high x up to 3 inches deep to the begin right corner of the bearing B4 masonry plate (Photo 101). There is exposed rusted reinforcement that is mostly bonded. The concrete beneath the bearing plate is sound.
- Pier 7 pedestal P1 – top left edge is cracked with 2 square foot of hollowness (Photo 102).
- Pier 7 pedestal P4 – top ½ of the begin face is cracked with 4 square foot of hollowness (Photo 103).
- Pier 9 pedestal P3 – begin face at top has 16" long x 6" high hollow area with a 13" long x 5" high x 2" deep spall (Photo 104). The spall has no exposed rebar and does not undermine the bearing masonry plate.
- Pier 11 pedestal P1 – all four sides are cracked; and there is 1.5 square foot of hollowness on the begin face and 0.5 square foot of hollowness on the end face (Photo 105).
- Pier 12 pedestal P1 – the end left is cracked 3 inches to 4 inches below the top edge.
- Pier 13 pedestal P1 – begin left top edge is spalled 2 feet wide x 6 inches high x 4 inches deep with rusted reinforcement; and the left side is cracked with 3 square foot of hollowness (Photo 106).
- Pier 14 pedestal P1 – the left side and left half of the top are cracked (Photo 107).

Pier – Cap Beam:
The pier cap beam had locations of cracked, hollow, and spalled concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

- Pier 2 pedestal bay 1 – begin bottom corner spalled 6' long x 8" deep with exposed rebar (Photo 108); end bottom corner spalled 7' long x 5" deep with exposed rebar (Photo109); bottom face hollow for 22 square feet.
- Pier 3 pedestal bay 2 – cracked and hollow sounding over the begin 1/3 and end 1/3 of the bay (Photo 110).
- Pier 3 column bay 1 – cracked throughout and hollow sounding over 31 square foot of the bottom surface (Photo 111).
- Pier 9 underside 6' to right of column 2 – 2 square foot hollow area with (2) 1/2" deep spalls measuring 15" x 6" and 5" x 10" (Photo 112). No rebar exposed.
- Pier 11 right side – vertical cracks and 4.5 square foot of hollowness (Photo 113).
- Pier 11 left side – vertical cracks and mapcracking of a patched area (Photo 114).
- Pier 14 left side – vertical cracks and 7.5 square foot of hollowness (Photo 115).

Pier – Stem:
There are crash walls at piers 2, 3, & 4. The pier stems at these piers had locations of cracked, hollow, and spalled concrete as illustrated on the Pier Deterioration Sketches. The begin face of pier 4 is in the worst condition of the three with large hollow areas totaling 30 square feet (Photo 116) and a 3 feet wide x 1.5 feet high x 1.5 inch deep spall near Column 2 at the top with exposed rebar (Photo 117).

Pier – Columns:
The pier cap beam had locations of cracked and hollow concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

- Pier 1 column C2 – the begin face has vertical cracks and 6.5 square foot of hollowness (Photo 118).
- Pier 3 column C2 – the begin face has vertical cracks and 15.5 square foot of hollowness (Photo 119).
- Pier 4 column C2 – the begin face has 5.5 square foot of hollowness (Photo 120).
- Pier 11 column C3 - the begin and end right sides have vertical cracks and 28 square foot of hollowness (Photo 113).
- Pier 14 column C3 – the right side has vertical cracks and 2 square foot of hollowness (Photo 115).

REMARKS

Pier – General Concrete Condition:
There is scattered cracking with locations of hollow areas and spalled concrete throughout as illustrated in the Pier Deterioration Sketches. The total hollow and spalled area; and percent of deteriorated pier concrete surfaces are noted in the table below:

PIER CONCRETE DETERIORATION QUANTITIES		
Pier No.	Deteriorated Area (square foot)	Percent of Deteriorated Area
1	27.1	2.3
2	98.8	5.4
3	119.5	6.3
4	74.1	3.7
5	10.2	0.6
6	22.3	1.4
7	30.1	2.2
8	7.2	0.5
9	34.0	2.4
10	27.5	2.1
11	48.1	4.25
12	27.7	2.7
13	47.5	5.2
14	20.8	2.6
Total	594.9	3.1

UTILITIES ITEMS
Lighting:
None.

Sign Structure:
None.

Utilities and Support:
None visible.

SPECIAL EMPHASIS ITEMS
Special Emphasis Inspection Required
- Non-Redundant/Fracture Critical Members – No
- Pin and Hangers – No
- Fatigue-Prone Welds – Yes
- Non-Categorized Fatigue-Prone Details – No
- Other – Yes

Special Emphasis Details
- Category 'D' welds at the ends 1'-0" radius at horizontal bracing gusset plates attached to bottom (tension) flanges of all girders in Spans 2 through 6 and in Span 10.
- High rocker bearings at the begin abutment and at piers 1 thru 3 and 6 thru 14.

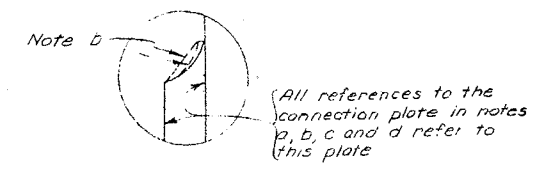
DETAIL "1



DETAIL "2

Note:
a. The connection plate shall be prepared and welded as a single bevel groove weld as shown in Detail #1. It shall then be Air Carbon-Arc gauged from the second side into sound weld metal and then welded as detailed. All welding shall be in the flat or "downhand" position.
b. The plate may be of any shape that will provide often welding, cutting, and finish grinding a smooth transition from the flange edge at a minimum radius of 12".
c. Both the connection plate and flange are to be the same type of steel.
d. Field welding to the connection plate will not be permitted.

LATERAL BRACING DETAILS
Not to Scale

The webs, flanges and gusset plates for bottom lateral bracing for the Span 3 girders shall be A.S.T.M. Designation A441 steel. Stiffeners, diaphragms, bearings, and bottom lateral bracing (except gusset plates) shall be A.S.T.M. A36 steel.

For additional details of bottom lateral bracing see drawing No. 22

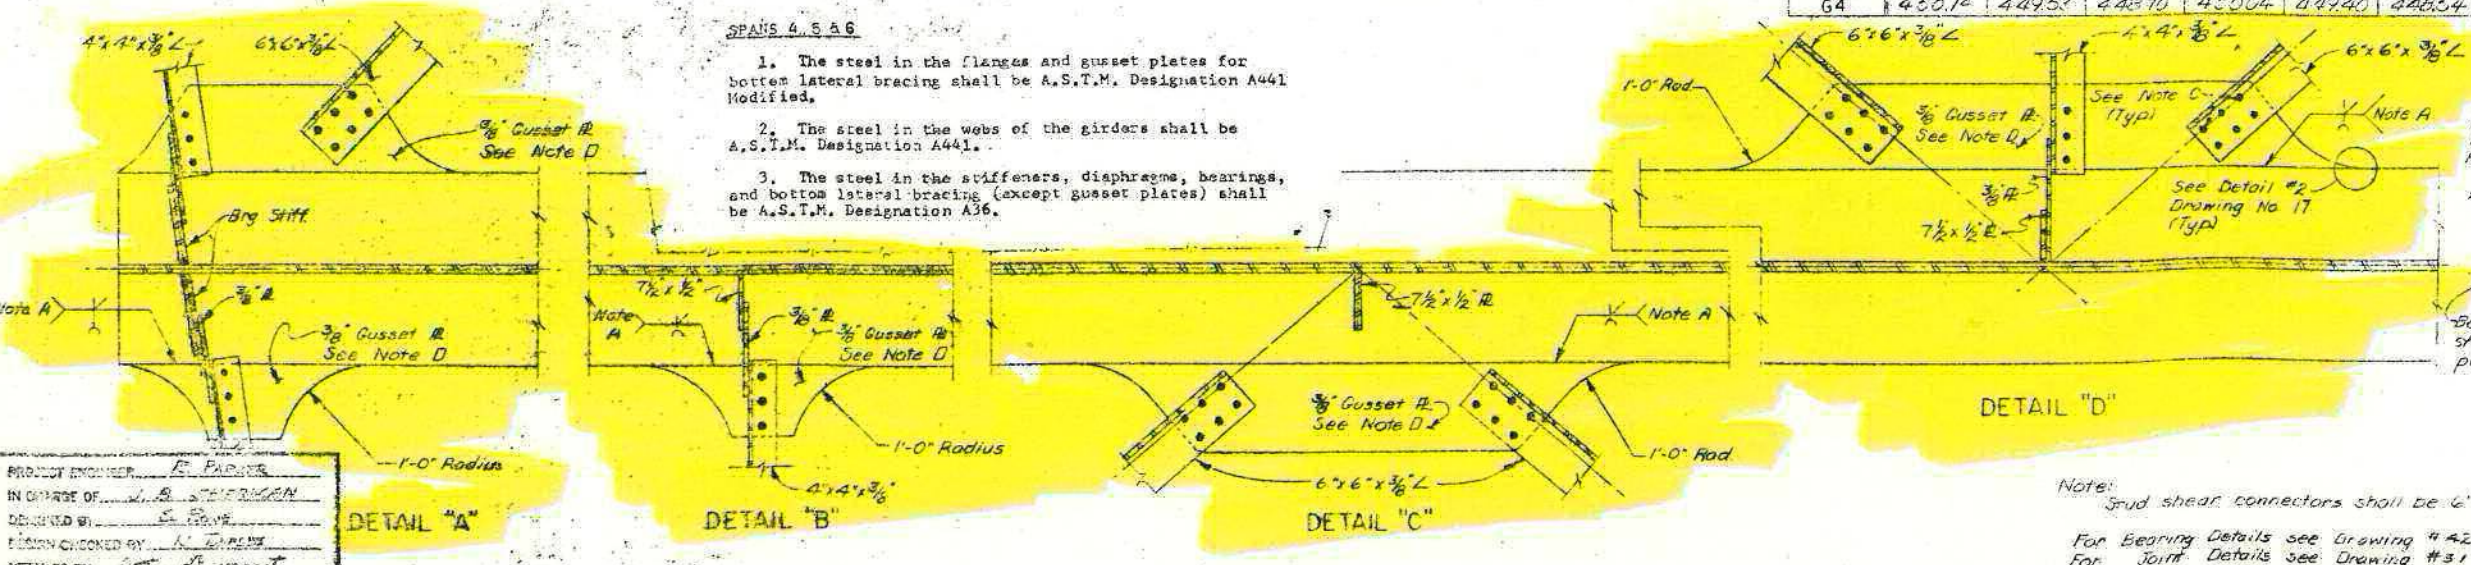
SPANS 4, 5 & 6

1. The steel in the flanges and gusset plates for bottom lateral bracing shall be A.S.T.M. Designation A441 Modified.
2. The steel in the webs of the girders shall be A.S.T.M. Designation A441.
3. The steel in the stiffeners, diaphragms, bearings, and bottom lateral bracing (except gusset plates) shall be A.S.T.M. Designation A36.



Height of Haunch varies see Table of Haunch Hgts Drg No 34

℄ Girder

Bottom of slab elevations shown in table are computed for this point.

Note:
Stud shear connectors shall be 6" high

For Bearing Details see Drawing # 42 and #43
For Joint Details see Drawing #31
For Trough Details see Drawing #33

Note:
A. The connection plate shall be prepared and welded as a single bevel groove weld as shown in Detail #1. It shall then be Air Carbon-Arc gouged from the second side into sound weld metal and then welded as detailed. All welding shall be in the flat or "downhand" position.
B. The plate may be of any shape that will provide after welding, cutting, and finish grinding a smooth transition from the flange edge of a minimum radius of 12".
C. Lateral bracing shall be attached to gusset plates with ⅞" ø high strength bolts. Field welding will not be permitted.
D. The gusset plate shall be the same type of steel as the flange to which it is welded.

SECTION B-B
Scale : 1" = 1'-0"

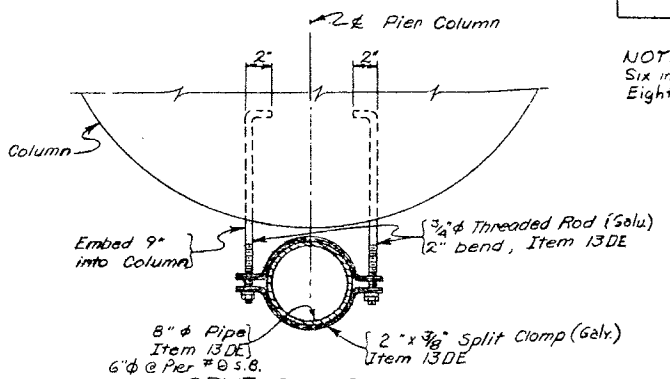
HOPPER ELEVATION
Scale : 1" = 1'-0"



SPLIT CLAMP DETAIL
Scale : 1½" = 1'-0"

Hoppers and downspouts (including all necessary pipe supports, hangers, and fittings) shall be paid for under Item 13DE-6 & Item 13DE-8.

Hopper shall be fabricated from steel plates, 3/8 inch thick, A.S.T.M. Designation A36 Steel. Hopper shall be galvanized after fabrication is complete in accordance with M19.

All bends in downspouts will be long radius bends. All indicated slopes on horizontal pipe runs will be the minimum allowed, and the long radius bends will be fabricated to take this slope into account. All costs involved will be included in the price bid for Item 13DE-6 & Item 13DE-8

PARAPET CONNECTION TO BOX BEAM GUIDE RAILING
Scale 3/4"=1'-0"

Notes:

All railing is to be fabricated and erected so that the rail is parallel to the parapet.

Since the finished railing must meet all requirements of fit, alignment and grade to the full satisfaction of the Engineer, it is suggested that complete field measurements be made before any shop fabrication is performed.

Aluminum rails, posts, post bases, clamp bars including stainless steel cap screws and lock washers, rail splices, rivets, end caps, pins, rail terminal ends, aluminum caulking compound and any necessary shims and/or pads and steel splice joint assembly between the end of the parapet and the box beam guide railing including tubular rail splice, end splice plate and anchor studs shall be paid for under the railing item.

Anchor bolts, nuts and washers shall be paid for under Item 20

After the anchor bolt nuts have been placed and tightened to the satisfaction of the Engineer, the bolts shall be cut off 1/8 inch above the nut and peened.

Rails shall be continuous over a minimum of three posts. On HPW type wingwalls the rails may be continuous over two posts.

Aluminum rivets shall be cold driven.

Galvanizing shall be done in accordance with Material Specification M19. Bolts to be galvanized shall have a Class 2A thread fit prior to galvanizing.

Materials used in the manufacture of this railing shall conform to the requirements and/or specifications listed below:

Piece	ASTM Designation	Commercial Alloy & Temper
Aluminum Extrusions (Posts, Post bases, rails, rail splices, clamp bars, pins and rail terminal ends)	B221	6061-T6
Aluminum Rivets	B316	6061-T6
Aluminum Plate Shims	B209	1100-0
Aluminum Rail End Caps	B26	43F or 356F
Steel Plate Shims	A36	
Steel Tubular Rail Splices	A500 Grade B or A501	
Steel Splice Plates	A36	
Steel Splice Bolts, Nuts and Washers	A307	
Steel Anchor Studs	A307	
Stainless Steel Anchor Bolts (100,000 psi. Min. Tensile Strength and 80,000 psi. Min. Yield Point)	A193 Grade B5 or A276 Type 304 or A276 Type 430	
Stainless Steel Cap Screws	A193 Grade B8	
Stainless Steel Spring Lock Washers shall be in accordance with the Military Standard MS3533a		
Stainless Steel Nuts for Anchor Bolts	A 194 Grade 6.	
Stainless Steel Washers for Anchor Bolts	A 167 Type 302 or 304

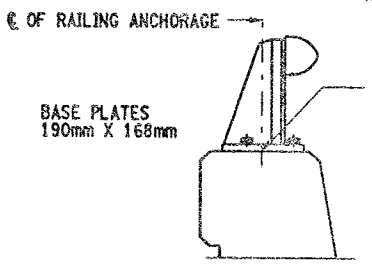
ASBESTOS MATERIAL REMOVAL NOTES:

THE REMOVAL OF ALL ASBESTOS CONTAINING CAULK (ITEM 210.5433M) SHALL BE COMPLETED PRIOR TO COMMENCEMENT OF ANY PARAPET REPAIR WORK.

THIS REMOVAL OF THE ASBESTOS CAULK SHALL BE PERFORMED AT EACH BRIDGE RAIL BASE PLATE ON BOTH N.B. & S.B. BRIDGES. (REMOVE ASBESTOS CALKING AT ALL RAIL BASE PLATES BOTH BRIDGES)

AFTER COMPLETION OF THE PARAPET REPAIRS INSTALL A CAULKING COMPOUND AROUND THE BASE PLATES OF THE RAILING WHICH MEETS MATERIAL SPECIF. 705-06 AND IS ACCEPTABLE TO THE ENGINEER. PAID UNDER ITEM 210.5433M.

REFER TO ORIGINAL CONTRACT PLANS F.I.S.H. 70-7 FOR RAIL LAY-OUT DETAILS.



REMOVE EXISTING GRAY ASBESTOS CAULKING COMPOUND AT THE ALUMINUM RAILING BASE PLATES, IT IS ASSUMED THAT THE CAULK COMPOUND IS SURROUNDING (PERIMETER) THE RAILING BASE PLATES. THIS PERIMETER REMOVAL OPERATION SHALL BE PERFORM AT EACH RAILING BASE PLATE ON BOTH STRUCTURES.

HOWEVER, SOME CAULK MATERIAL MAY BE FOUND UNDER THE RAILING BASE PLATES. THIS CAULKING COMPOUND UNDER THE BASE PLATES SHALL BE REMOVED ONLY AT LOCATIONS WHERE THE PARAPET CONCRETE REPAIRS WILL DISTRUB THE MATERIAL (REMOVAL AS ENCOUNTERED).

ALL COSTS TO BE PAID UNDER ITEM 210.5433M. SEE ASBESTOS MATERIAL REMOVAL NOTES, THIS SHEET.

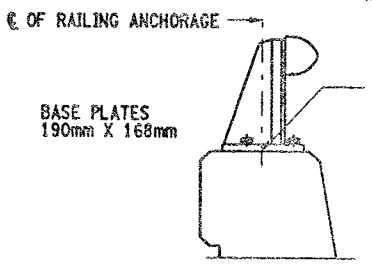
ASBESTOS MATERIAL REMOVAL NOTES:

THE REMOVAL OF ALL ASBESTOS CONTAINING CAULK (ITEM 210.5433M) SHALL BE COMPLETED PRIOR TO COMMENCEMENT OF ANY PARAPET REPAIR WORK.

THIS REMOVAL OF THE ASBESTOS CAULK SHALL BE PERFORMED AT EACH BRIDGE RAIL BASE PLATE ON BOTH N.B. & S.B. BRIDGES. (REMOVE ASBESTOS CALKING AT ALL RAIL BASE PLATES BOTH BRIDGES)

AFTER COMPLETION OF THE PARAPET REPAIRS INSTALL A CAULKING COMPOUND AROUND THE BASE PLATES OF THE RAILING WHICH MEETS MATERIAL SPECIF. 705-06 AND IS ACCEPTABLE TO THE ENGINEER. PAID UNDER ITEM 210.5433M.

REFER TO ORIGINAL CONTRACT PLANS F.I.S.H. 70-7 FOR RAIL LAY-OUT DETAILS.



REMOVE EXISTING GRAY ASBESTOS CAULKING COMPOUND AT THE ALUMINUM RAILING BASE PLATES, IT IS ASSUMED THAT THE CAULK COMPOUND IS SURROUNDING (PERIMETER) THE RAILING BASE PLATES. THIS PERIMETER REMOVAL OPERATION SHALL BE PERFORM AT EACH RAILING BASE PLATE ON BOTH STRUCTURES.

HOWEVER, SOME CAULK MATERIAL MAY BE FOUND UNDER THE RAILING BASE PLATES. THIS CAULKING COMPOUND UNDER THE BASE PLATES SHALL BE REMOVED ONLY AT LOCATIONS WHERE THE PARAPET CONCRETE REPAIRS WILL DISTRUB THE MATERIAL (REMOVAL AS ENCOUNTERED).

ALL COSTS TO BE PAID UNDER ITEM 210.5433M. SEE ASBESTOS MATERIAL REMOVAL NOTES, THIS SHEET.

NOTES:

THE CONTRACTOR SHALL SUPPLY MULTI-ROTATIONAL STRUCTURAL BRIDGE BEARINGS CONFORMING TO THE REQUIREMENTS OF STANDARD SPECIFICATION SECTION 565 AND SUBJECT TO THE FOLLOWING CONDITIONS:

1. THE BEARING DEVICES SUPPLIED SHALL BE CAPABLE OF TRANSMITTING THE LOADS AND MOVEMENT SHOWN ON THESE PLANS.
2. THE DIMENSION "H" IN THE BEARING TABLE REPRESENTS THE ASSUMED TOTAL HEIGHT OF BEARING MECHANISM BETWEEN THE SOLE PLATE AND MASONRY PLATE USED BY THE DESIGNER TO ESTABLISH THE PEDESTAL ELEVATIONS. THE MINIMUM PEDESTAL HEIGHT SHALL NOT BE CHANGED WITHOUT WRITTEN APPROVAL OF THE DEPUTY CHIEF ENGINEER (STRUCTURES).
3. MASONRY PLATES ARE TO BE DESIGNED. THE MINIMUM CONCRETE EDGE DISTANCE SHALL BE 75 mm AND THE MINIMUM ANCHOR BOLT COVER SHALL BE 200 mm.
4. THE BEARING DEVICE, MASONRY PLATE, SOLE PLATE, ANCHOR BOLTS, NUTS, WASHER PLATES AND BEARING PAD SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE BEARING ITEMS.
5. ALL EXPANSION BEARINGS SHALL HAVE A MAXIMUM FRICTION COEFFICIENT OF 3%.
6. IF THE ANCHOR BOLTS ARE SET UNDER THE SOLE PLATE, A MINIMUM CLEARANCE EQUAL TO TWO TIMES THE THICKNESS OF ANCHOR NUT PLUS 25 mm SHALL BE MAINTAINED BETWEEN THE TOP OF MASONRY PLATE AND BOTTOM OF THE SOLE PLATE.
7. ALL STEEL SHALL CONFORM TO ASTM A588M.
8. ALL METAL COMPONENTS OF THE BEARING SYSTEM WHICH ARE LIABLE TO COME INTO CONTACT DURING THE TRANSLATION SHALL HAVE A TEFLON SLIDING SURFACE FINISH.
9. ALL STEEL FABRICATION SHALL CONFORM TO THE PROVISIONS OF THE LATEST EDITION OF THE NEW YORK STATE STEEL CONSTRUCTION MANUAL.

WHENEVER JACKING OF THE SUPERSTRUCTURE IS NEEDED TO RESET THE BEARINGS, THE CONTRACTOR SHALL SUBMIT A JACKING SEQUENCE TO THE E.I.C. FOR APPROVAL.

LIST OF ITEMS USED:

ITEM 565.1522M - TYPE M.R. EXPANSION BEARING (1001 TO 2000KN) (EA)
ITEM 565.1722M - TYPE M.R. FIXED BEARING (1001 TO 2000KN) (EA)

*ONE WAY LONGITUDINAL MOVEMENT IS THE MAXIMUM ONE WAY MOVEMENT (EXPANSION OR CONTRACTION) OF THE SUPERSTRUCTURE WHEN BEARINGS ARE SET @ 20°C PLUS 25 MILLIMETERS OF TOLERANCE.

**ON WIDE STRUCTURES AND ON CURVED STRUCTURES PROVISIONS SHALL BE MADE FOR LIMITED LATERAL MOVEMENT.

PAINT REMOVAL NOTE:

1. IN CONJUNCTION WITH THE USE OF ITEM 16570.32M AND ITEM 16570.76M. ITEM 571.01NNNNM - TREATMENT & DISPOSAL OF PAINT REMOVAL WASTE AND EITHER ITEM 570.10NNNNM - ENVIRONMENTAL GROUND PROTECTION OR ITEM 570.09NNNNM - ENVIRONMENTAL WATER PROTECTION SHALL ALSO BE INCORPORATED DURING THE PAINT REMOVAL OPERATIONS.
2. ALL NEW PARTS INSTALLED AT THIS LOCATION SHALL BE INCLUDED IN THE UNIT PRICE BID FOR ITEM 15565.4302. THE CONTRACTOR WILL BE PAID FOR A QUANTITY OF ONE FOR ALL NEW MATERIALS AT THIS LOCATION.
3. ALL EXISTING SURFACES SHALL BE CLEANED AND LUBRICATED TO ENSURE FREE MOVEMENT, ITEM 15565.4302M.

LIST OF ITEMS USED:

ITEM 571.010001M - TREATMENT AND DISPOSAL OF PAINT REMOVAL WASTE (CM)
ITEM 571.010002M - TREATMENT AND DISPOSAL OF PAINT REMOVAL WASTE (CM)
ITEM 15565.4302M - BRIDGE BEARING RESTORATION (EA)

BRIDGE BEARING RESTORATION NOTES:

1. BRIDGE BEARING RESTORATION ITEM 15565.4302M SHALL INCLUDE ALL DESIGNATED WORK AS PER THE SPECIFICATION.
2. STRUCTURAL LIFTING SHALL BE USED WITH ALL EXPANSION BEARING RESTORATION.
3. IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER SPAN (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARINGS), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN SPECIFICATIONS SECTON 585-STRUCTURAL LIFTING OPERATIONS.
4. BEARING RESTORATION SHALL AS A MINIMUM, AND IN ALL CASES INCLUDE REPLACEMENT OF BRONZE PLATE.
5. FIXED BEARING TO BE CLEANED IN PLACE. DO NOT DISASSEMBLE.
6. ON BINS 1093571 & 1093572, BRIDGE BEARING RESTORATION ITEM 15564.4302M FOR THE HIGH ROCKER BEARINGS SHALL INCLUDE ONLY THOSE BEARINGS SHOWN ON DWG BR-11 WHICH ARE EITHER OVER EXTENDED OR UNDER EXTENDED MORE THAN 5° FROM WHAT SHOULD BE ANTICIPATED FOR THE AMBIENT TEMPERATURE. THOSE EXPANSION BEARINGS WHICH ARE BEING RESTORED SHALL BE RESET TO ORIGINAL SPECIFICATIONS.

JACKING NOTES:

THE METHOD OF LIFTING SHALL BE APPROVED BY THE DEPUTY CHEIF ENGINEER (STRUCTURES), DSES, TWO WEEKS PRIOR TO THE START OF THE WORK.

NO LIFTING WILL BE ALLOWED UNTIL ALL TEMPORARY SUPPORTS ARE SECURED.

WHEN POSSIBLE, THERE WILL BE NO LIVE LOAD DURING LIFTING.

LIFTING SHALL BE CONFINED TO ONE END OF A SPAN AT ANY ONE TIME.

IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER PIER (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARING), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN THE SPECIFICATION SECTION 585-STRUCTURAL LIFTING OPERATIONS.

2. THIS DEPTH SHALL BE INDICATED ON THE SHOP DRAWINGS AND SHALL BE SUCH THAT WHEN THE SEAL IS COMPRESSED TO 50% OF ITS NORMAL WIDTH, THE TOP OF THE SEAL SHALL BE NOT LESS THAN 6mm NOR MORE THAN 19mm BELOW THE TOP OF THE ROADWAY.
3. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACE AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE, FOR 12 HOURS. NOTE THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, SEE INSERT IN PROJECT PROPOSAL.
4. A WATER-TIGHT INTEGRITY TEST SHALL BE PERFORMED BY THE CONTRACTOR AT ALL COMPRESSION SEAL JOINT INSTALLATIONS. THE FOLLOWING TEST PARAMETERS SHALL BE INCORPORATED IN THE TEST:
   1. A 15 MINUTE MINIMUM PERIOD OF STANDING WATER, WITH A 25mm MINIMUM DEPTH SHALL BE USED.
   2. IN ADDITION, IN LOCATIONS OF COPED AREAS OF THE SEAL, BENDS, ETC., WATER PRESSURE SHALL BE APPLIED, TO THE SATISFACTION OF THE E.I.C FOR A 15 MINUTE PERIOD.
   3. LIMITS OF TEST AREA SHALL BE FROM FACE OF CURB TO FACE OF CURB ON THE DECK SURFACE.
5. NO PAYMENT WILL BE MADE TO THE CONTRACTOR FOR THE JOINT IF, IN THE OPINION OF THE ENGINEER, THE INSTALLED JOINT LEAKS WITHIN THE 15 MINUTE TEST PERIOD.
6. PRIOR TO THE START OF WORK AT EACH JOINT, THE CONTRACTOR SHALL SUBMIT A WRITTEN PLAN FOR THE SPECIFICS OF THE TESTING, INCLUDING CONTAINMENT OF THE WATER AND THE METHOD TO BE USED FOR ACCESS BY THE E.I.C. TO THE BOTTOM OF THE JOINT BEING TESTED.
7. THE COST OF ALL LABOR, EQUIPMENT AND MATERIALS REQUIRED FOR THE TESTING WHICH INCLUDES, BUT IS NOT LIMITED TO:
   1. A CONTAINMENT SYSTEM FOR THE TEST WATER.
   2. PROVISIONS FOR E.I.C. ACCESS TO THE BOTTOM OF THE JOINT.
   SHALL BE INCLUDED IN THE PRICE BID FOR THE RESPECTIVE JOINT ITEMS.
8. THE COST OF ALL LABOR, EQUIPMENT, AND MATERIALS TO INSTALL THE NEW JOINT SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT ITEM.
9. MORTAR LEVELING COURSE SHALL CONFORM TO MATERIAL SPECIFICATION 701-09 AND SHALL BE INCLUDED IN THE PRICE BID FOR THE APPROPRIATE JOINT ITEM.
10. THE DIMENSIONS OF THE REMOVAL AREA UNDER THE 152x10 PLATES ARE SHOWN TO ALLOW SPACE FOR THE PLATES TO REST FREELY. IF THERE IS ALREADY ADEQUATE SPACE, NO CONCRETE REMOVAL OR REPLACEMENT IS REQUIRED IN THIS AREA.
11. 16 mm ∅ ASTM A325M ANCHOR BOLT TO BE DRILLED AND GROUTED IN PLACE IN ACCORDANCE WITH THE REQUIREMENTS OF SUB-SECTION 586-3.02. GROUTING MATERIALS SHALL BE IN ACCORDANCE WITH MATERIALS SUB-SECTION 701-07 ANCHORING MATERIALS-CHEMICALLY CURING. HOLES TO BE DRILLED TO THE DIAMETER AND DEPTH RECOMMENDED BY THE MANUFACTURER OF THE GROUTING MATERIAL (MIN. DEPTH OF 150 mm). THE COST OF THE ANCHORS, INCLUDING DRILLING AND GROUTING, SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROPRIATE JOINT SYSTEM ITEM.
12. IT IS DESIRABLE TO HAVE THE ARMORED JOINT WITH ITS COMPRESSION SEAL ASSEMBLED IN THE SHOP AND DELIVERED TO THE JOB SITE ALL SET FOR INSTALLATION IN ITS PREFORMED RECESS IN THE STRUCTURAL SLAB. IN CASES WHERE THE ARMORED JOINT CANNOT BE ASSEMBLED IN THE SHOP, DUE TO ITS EXCESSIVE LENGTH CAUSING SHIPPING PROBLEMS, THE JOINT SHALL BE SEALED WITH THE COMPRESSION SEAL BEFORE THE STRUCTURE IS OPENED TO TRAFFIC INCLUDING CONSTRUCTION TRAFFIC, AND BEFORE DIS CONTINUING OPERATIONS WHEN WORK IS SUSPENDED DURING THE WINTER.

EPOXY POLYSULFIDE GROUT NOTE:

CONTRACTOR MAY WITH THE APPROVAL OF THE ENGINEER USE MATERIAL SPECIFICATION 721-03 EPOXY POLYSULFIDE GROUT, AT THE RECESSES, INSTEAD OF THE 12 HOUR CONTINUOUS PREWETTING REQUIREMENTS (PROJECT PROPOSAL). CONTRACTOR MUST ENSURE PROPER CONSTRUCTION PRACTICES ARE FOLLOWED WHEN USING THIS GROUT. THE USE OF EPOXY POLYSULFIDE GROUT SHALL BE AT NO ADDITIONAL COST TO THE STATE.

SEALS (mm)			ARMORED JOINT SYSTEM	
TYPE	NOMINAL WIDTH	DIM. "A" @ 20°C.	TYPE	END CONDITION
1	44	25	A1	Fixed End Only
2	51	30	A2	Exp. up to 18 m
3	64	38	A3	Exp. over 18 m to 23 m
4	76	44	A4	Exp. over 23 m to 27 m
5	89	52	A5	Exp. over 27 m to 38 m
6	102	60	A6	Exp. over 38 m to 46 m

Maximum Skew Limits: Fixed End - No Limit
Exp. End - 45° A2 thru A6

WORK TO BE DONE:

BIN 1093571 SB

- REMOVE ARMORING DECK ANGLE AND REPLACE BRIDGE JOINT AT BEGINNING ABUTMENT.
- REPAIR CONC. HEADERS AT PIERS 1, 2 & 9.
- CLEAN DRAINAGE SYSTEM AT PIERS 1, 2, 3, 4, 5 & 9.
- REPLACE BRIDGE JOINTS AT PIERS 6, 7, 8, 10, 11, 12, 13 & 14.
- REMOVE ARMORING DECK ANGLE AT END ABUTMENT.

BIN 1093572 NB

- REMOVE ARMORING DECK ANGLE AND REPLACE BRIDGE JOINT AT BEGINNING ABUTMENT.
- REPAIR CONC. HEADERS AT PIERS 1 & 2.
- CLEAN DRAINAGE SYSTEM AT PIERS 1, 2, 3, 4 & 5.
- REPLACE BRIDGE JOINTS AT PIERS 6, 7, 8, 9, 10, 11, 12, 13, & 14.
- REMOVE ARMORING DECK ANGLE AT END ABUTMENT.

NOTES:

1. ALL NOTES & DETAILS ON DWG. NO. JD-24 SHALL APPLY.
2. REFER TO DWG. NO. JD-53 & JD-54 FOR PROPOSED PARTIAL PLAN VIEWS.
3. FOR CALCULATION OF "J" DIMENSION REFER TO DWG. NO. JD-24.
4. ALL WELDS SHALL BE GROUND SMOOTH TO THE SATISFACTION OF THE ENGINEER, ON SEAL CONTACT SIDE OF EDGE BEAM.
5. RECESSES RECEIVING ITEM 555.09M, AFTER SURFACE PREPARATION, THOROUGHLY WET THE CONCRETE SURFACES AND ALL POROUS SURFACES TO BE IN CONTACT WITH NEW CONCRETE FOR 12 HOURS. NOTE, THE USE OF MATERIAL SPECIF. 705-22 PORTLAND CEMENT MORTAR BONDING GROUT HAS BEEN ELIMINATED, (PROJECT PROPOSAL).

CLEAN DRAINAGE SYSTEM NOTE:

THE FOLLOWING CLOSED DRAINAGE SYSTEMS SHALL BE CLEANED UNDER THIS CONTRACT.

BIN 1093571 - PIERS 1, 2, 3, 4, 5, & 9
BIN 1093572 - PIERS 1, 2, 3, 4, 5 & 6

NOTE, AT PIER #6 THE TYPE OF BRIDGE JOINT IS AN ARMORED JOINT WITH COMPRESSION SEAL. THE DOWNSPOUTS ARE CONNECTED TO THE BRIDGE SCUPPERS.

THE CLEANING OF THE EXISTING DRAINAGE SYSTEM (ITEM 203.18M) SHALL BE FROM HOPPER (FASCIA GIRDER) TO HOPPER (FASCIA GIRDER) AND SHALL INCLUDE THE PVC TROUGH AND THE ENTIRE DOWNSPOUT SYSTEM (DIA. OF DOWNSPOUTS VARY) FROM HOPPERS TO OUTLET. REFER TO DWG. NO. DD17-1 THRU DWG. NO. DD17-4 FOR DRAINAGE DETAILS AND PROPOSED MODIFICATIONS TO PIER DOWNSPOUTS.

FOR ESTIMATING THE QUANTITY FOR ITEM 203.18M. THE FOLLOWING INFORMATION IS ASSUMED:

BIN 1093571 - PIERS 1, 2, 3, 4, 5, & 9
(256 METERS TOTAL)

BIN 1093572 - PIERS 1, 2, 3, 4.5 & 6
(269 METERS TOTAL)

CONTRACTOR SHALL TAKE CARE WHEN PERFORMING CLEANING OPERATION NOT TO DAMAGE THE EXISTING DRAINAGE SYSTEM. ANY DAMAGE CAUSED BY CONTRACTOR'S OPERATIONS SHALL BE REPAIRED OR REPLACED AS DEEMED NECESSARY BY THE ENGINEER AT NO ADDITIONAL COST TO THE STATE.

ELASTOMERIC CONCRETE NOTE:

1. AN EXPERIENCED TECHNICAL REPRESENTATIVE EMPLOYED BY THE MANUFACTURER OF THE ELASTOMERIC CONCRETE SHALL BE PRESENT DURING ALL PHASES OF SUBSTRATE PREPARATION AND MATERIAL PLACEMENT.
2. THE WATERTIGHT INTEGRITY TEST SHALL NOT BE REQUIRED FOR THE OPEN JOINT HEADER REPAIRS, WHERE ELASTOMERIC CONCRETE (ITEM 18567.46M) IS USED, FOR THESE TWO STRUCTURES ONLY.
3. THE REMOVAL DIMENSIONS MAY BE ADJUSTED TO ENSURE THAT ALL DETERIORATED CONCRETE ADJACENT TO THE JOINT AREA IS ENCOMPASS, AOBE.

ALL DIMENSIONS ARE IN mm UNLESS OTHERWISE NOTED

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1-09357-1
Interstate Route 481 South Bound over Conrail

Prepared for:

New York State
Department of Transportation

PIN 3804.00.101

LaBella Project No. 97132

May, 1998

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 South Bound Bridge over Conrail. Based on laboratory analyses of bulk samples collected, the following materials were determined to contain asbestos:

BIN 1-09357-1 Interstate Route 481 South Bound over Conrail

Type of Material	Estimated Amount
Sheet Packing	7 Square Meters
Caulking Compound	37.4 Linear Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 South Bound Bridge over Conrail (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09357-1 Interstate Route 481 South Bound over Conrail

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 7 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Caulking Compound

Asbestos-containing caulking compound is located around some of the guide rail base plates on both parapets on the bridge. It is estimated that the total amount of this caulking compound is approximately 37.4 linear meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this material are shown in the attached FIGURE 2. Analytical results of bulk samples collected are summarized in the attached TABLE.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note ID: 3A1310935710000

Beg Abut -- Abutment: Joint with Deck -- Rated 5, Was 6
Referenced Photos: "1"
2013 - The begin abutment joint with deck header and seal are intact and in good overall condition without leakage, but the seal is partially filled with sand and roadway debris. However, the joint functions adequately.

Note ID: 3A1310935710002

Approaches: Drainage -- Rated 4, Was 4
Referenced Photos: "3"
2013 - The top of the catch basin at the right side of the end approach is completely plugged and has vegetation growing on all areas of the top grating surface. Approach drainage would otherwise rate '5'.

Note ID: 3A1310935710003

Span 013 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Span 014 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Span 015 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Referenced Photos: "38", "40"
2013 - The deck wearing surface along the wheel paths in all spans is beginning to wear smooth with a diminished depth of sawcut grooving in these areas (Photos 38 & 40). Some areas also appear to be polished.

There are also a few longitudinal cracks in the deck wearing surface scattered throughout all spans (Photos 38 & 40). The worst cracks are in Spans 6, 7 & 12.

The deck wearing surface would otherwise rate '5' or '6' in all spans.

Referenced Photos: "52", "16"
2013 - The right and left concrete fascias have minor to moderate horizontal hairline cracking with hollow areas, delamination and rust staining in isolated areas of all spans (Photo 52). In addition, the right fascia at the superstructure joint at Pier 3 has severe deterioration and spalling with punky concrete (Photo 16). Less severe deterioration and spalling has also developed at other superstructure joints.

The approximate 1' top portion of concrete "lip" is rated as parapet instead of fascia for purposes of this inspection.

Note ID: 3A1310935710007

Referenced Photos: "4", "17", "27", "31", "32"
2013 - The right and left concrete parapets in all spans typically have horizontal cracks with isolated rust stains on the inside face approximately 6" below the top and in the areas surrounding previous concrete patches (Photos 4, 17 & 27). The worst area of cracking and rust staining is on the inside face near the top of the left parapet in Span 5 near midspan (Photo 31).

The top of the outside face of the right parapet in Span 5 near midspan also has an approximate 5' long by up to 3" deep area of severe spalling with exposed corroded reinforcement (Photo 32).

2013 - Exterior areas of bottom flanges of fascia girders in all spans have peeling paint with significant paint loss (Photo 53). Section loss is minimal in these areas. Remaining areas of main girders in all spans have minor paint deterioration and failure, mainly along bottom flanges (Photos 28 & 45).

Additional peeling paint and paint failure resulting in rust and corrosion have occurred on superstructure steel beneath leaky superstructure joints at most piers (Photos 20 & 21).

2013 - Open troughs at superstructure joints at Piers 1 - 5 & 9 are almost completely plugged with roadway debris that severely restricts proper drainage (Photos 23, 35 & 46). Trough support framing at these piers is intact, but with minor rust and corrosion (Photos 10 & 47).

Steel framing along finger joints at Piers 1 - 5 & 9 has minor to moderate to severe corrosion with flake rust and delamination with substantial section loss (Photos 22, 34, 35).

The tops of superstructure joints with rubber seals are partially filled with sand and roadway debris (Photo 9). The undersides of superstructure joints in Spans 6, 7, 8 & 14 have deteriorated and spalled concrete almost full length of the joints

Referenced Photos: "5", "48", "50"
2013 - Several rocker bearings at the piers are under/over-extended for the ambient air temperature on the day of inspection (Photo 50). The worst under/over-extended high rocker bearing on any pier was the bearing supporting Girder G1 on Pier 11 (Photo 48). This bearing was under-extended by 6.67 degrees at 85 degrees Fahrenheit and was under-extended by 8.68 degrees at 60 degrees Fahrenheit (Photo 48). See the attached High Rocker Bearing Documentation Table for recorded measurements at different temperatures.

All high rocker bearings on Pier 11 were under-extended and in a contraction mode at 85 degrees Fahrenheit. The bearing supporting Girder G1 had the most severe under-extension of the remaining bearings on this pier (Photo 48). It is recommended that this bearing be monitored when the ambient air temperature is less than 10 degrees Fahrenheit during a cold period during the winter because, based on recorded measurements, substantial under-extension is likely as the temperature decreases during cold weather.

Minor to moderate pack rust has developed beneath the rockers of all high rocker bearings on all piers (Photo 5). Remaining areas of pier bearings have minor to moderate peeling paint with rust and minor corrosion (Photo 50).

Note ID: 3A1310935710000D

Span 001 -- Pier: Pedestals -- Rated 4, Was 4
Span 002 -- Pier: Pedestals -- Rated 4, Was 4
Span 003 -- Pier: Pedestals -- Rated 4, Was 4

Referenced Photos: "6", "11", "24"
2013 - The left face of Pedestal 1 on Pier 1 is hollow sounding and has cracking, efflorescence and spalling with exposed corroded reinforcement (Photo 6). The spalled area is not affecting the bearing area.

Three of four pedestals on Piers 2 & 3 have cracking on two or more faces (Photo 11). Pedestals 4 on Piers 2 & 3 also have areas of cracking,

Note ID: 3A131093571000D - continued

efflorescence and spalling with exposed corroded reinforcement (Photo 24).
However, these pedestals provide adequate support for the bearings.

Remaining pedestals on Piers 1, 2 & 3 would rate '5' alone.

Note ID: 3A1310935710012

Span 001 -- Pier: Pier Columns -- Rated 4, Was 4
Referenced Photos: "7"
2013 - Approximately 30% of the left face of Column 3 of Pier 1 has delaminated and hollow sounding concrete. Remaining areas of the Pier 1 columns have small isolated areas of cracking and surface spalls, but the columns are generally solid and would rate '5' alone.

Note ID: 3A1310935710008

Referenced Photos: "8", "18", "33", "43"
2013 - Scuppers in Spans 2 through 15 are typically plugged with sand and roadway debris (Photos 8 & 43). In addition, downspout hoppers are typically plugged up to 3/4 full with sand and roadway debris (Photo 18).

Piers with original ductile iron downspouts and those with new PVC downspouts are summarized on the attached Scupper Downspout Documentation. Original ductile iron downspouts have peeling paint, rust and corrosion. New PVC downspouts would rate '7' alone (Photo 33).

Note ID: 3A131093571000E

Span 002 -- Pier: Stem Solid Pier -- Rated 5, Was 5
Span 003 -- Pier: Stem Solid Pier -- Rated 5, Was 5
Referenced Photos: "12", "26"
2013 - Solid pier stem crash walls at Piers 2 & 3 were rehabilitated in the past, but currently have large scale map cracking (shrinkage cracking) with isolated areas of efflorescence and minor rust staining throughout (Photos 12 & 26). However, this condition is not sufficiently detrimental to warrant a rating lower

than '5' for these elements.

Note ID: 3A1310935710010

Span 002 -- Pier: Cap Beam -- Rated 4, Was 5
Referenced Photos: "13", "14"
2013 - Lower portions of the begin and end faces of the concrete cap beam at Pier 2 have horizontal cracking, efflorescence, delaminating concrete and deterioration and spalling to 3" deep with exposed corroded reinforcement (Photos 13 & 14).

Remaining areas of the Pier 2 cap beam have minor map cracking, but the concrete is solid and would otherwise rate '5' alone.

Note ID: 3A1310935710013

Span 002 -- Pier: Pier Columns -- Rated 5, Was 5
Span 011 -- Pier: Pier Columns -- Rated 5, Was 5
Referenced Photos: "15", "49"
2013 - The columns of Piers 2 & 11 have map cracking and small isolated areas of cracking, surface spalls and rust staining, but the columns are generally solid (Photos 15 & 49).

Note ID: 3A1310935710009

Span 003 -- Superstructure: Secondary Members -- Rated 4, Was 4
Referenced Photos: "19", "20"
2013 - Moderate to severe rust and corrosion with corrosion holes have developed in the cross bracing gusset plate below the superstructure joint at the end of Span 3 and the bottom K-bracing bars in this area have thinned out from corrosion and delamination (Photos 19 & 20).

Remaining areas of secondary members in Span 3 would rate '5' or '6' alone.

Note ID: 3A1310935710011

Span 003 -- Pier: Cap Beam -- Rated 5, Was 5
Referenced Photos: "25"
2013 - Concrete cap beams at all piers, except Pier 2, have varying degrees of map cracking, horizontal cracking, delaminating concrete and rust staining, but most areas of the cap beams are solid.

Inspection Date: 7/9/2013 RC: 33 BIN: 1093571

Span 004 -- Pier: Stem Solid Pier -- Rated 4, Was 5
Referenced Photos: "29", "30"
2013 - The solid pier stem crash wall at Pier 4 was rehabilitated in the past, but currently has large scale map cracking (shrinkage cracking) with isolated areas of cracking, efflorescence and minor rust staining throughout (Photo 30). The begin face of the pier stem crash wall at Pier 4 also has an approximate 3 square foot isolated area of deterioration and spalling with exposed corroded reinforcement along the top edge (Photo 29).

Note ID: 3A1310935710004

Span 006 -- Deck Elements: Mono Deck Surface -- Rated 4, Was 5
Span 007 -- Deck Elements: Mono Deck Surface -- Rated 4, Was 5
Span 012 -- Deck Elements: Mono Deck Surface -- Rated 4, Was 4
Referenced Photos: "38", "40"
2013 - The mono deck surface along the wheel paths in all spans is beginning to wear smooth with a diminished depth of sawcut grooving in these areas (Photos 38 & 40).

There are also a few longitudinal cracks in the mono deck surface scattered throughout all spans (Photos 38 & 40). The worst cracks are in Spans 6, 7 & 12.

The mono deck surface would otherwise rate '5' in Spans 6, 7 & 12.

Note ID: 3A1310935710005

Span 007 -- Superstructure: Structural Deck -- Rated 6, Was 6
Referenced Photos: "41"
2013 - The structural deck in all spans is in generally very good condition, except for isolated areas of rust and corrosion along the underside of the corrugated stay-in-place forms in areas of apparent leakage.

Note ID: 3A1310935710001

End Abut -- Wingwalls: Walls -- Rated 4, Was 4
Referenced Photos: "2"
2013 - The end right cheek wall is has cracking with efflorescence and spalling at the lower inside corner. The spalled area is approximately 1 square foot by up to 4'' deep at the deck haunch/seat area. Remaining areas of the end wingwalls (cheek walls) would rate '5' or '6' alone.

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 481I 481I33012069 Crossed: CSX TRANS/AMTRAK CheckValue: 1,864,105,860

Overall Condition:

GENERAL RECOMMENDATION: 5

Computed Condition Rating: 4.429

Problems Requiring Action:

FURTHER INVESTIGATION IS NEEDED
Monitor G1 high rocker bearing on Pier 11 when very cold.

NO Flags Issued

POSTINGS:

Inspector Confirmed existing Posting data as correct.
Posted Vertical Clearance ON the bridge is: No Posting
Posted Vertical Clearance UNDER the bridge is: No Posting
No Load Restriction is posted on this bridge

Overloads Observed:

NO Overload Vehicles were observed on this bridge

FEDERAL RATINGS:

NBI Deck Condition: 6
NBI Superstruct Condition: 6
NBI Substruct Condition: 5
NBI Channel Condition: N
NBI Culvert Condition: N

Diving Inspection Needs:

Diving Inspection Required? No Date of Last Diving Inspection: No Date

Inventory Problems:

Inventory Problems Exist? No

Miscellaneous:

Time Required to Inspect Bridge: 16.5 Hours

Lane Closure Needs: By Contract for 15 Hours

Railroad Flagging is Required for 12.0 Hours

No Pedestrian Fence

No Snow Fence

The BIN Plate is in OK condition

Inspection Date: 7/9/2013 RC: 33 BIN: 1093571

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 481I 481I33012069 Crossed: CSX TRANS/AMTRAK CheckValue: 1,864,105,860

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - Yes
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

2013 - A 100% hands-on inspection was performed on all special emphasis details.

Category 'D' welds at the ends of 1'-0" radius gusset plates attached to bottom (tension) flanges of exterior and first interior girders in Spans 2 through 6 and in Span 10 as shown on Sheets 21, 22 & 26 of the plans.

General Notes To the Next Inspector:

2013 - A CSX Railroad Flagman is required for access to Spans 1 - 5 for use of a 60' UBIU and for access to Piers 1 - 4.
Access to Spans 6 - 15 from above is with a 60' UBIU.
Access to Spans 6 - 15 from below is through a CSX rail yard gate and along a maintenance road between the two I481 bridges.

The bridge is at CSX Railroad Milepost QC 285.23.

Improvements Observed:

2013 - None

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JUNE 10, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093571 (I-481 Southbound / CSX Trans/Amtrak)

This memorandum summarizes the seismic screening conducted for BIN 1093571 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Seat width improvements are required at piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck for the entire bridge averages 4% of the bridge deck surface area and varies by span ranging between 1.3% and 15.5% of the span deck surface area. The cores indicate the reinforcement steel is 4.5 inches to 5 inches below the surface of the deck. Additionally, the cores indicate the reinforcement steel is epoxy coated. The core lab tests indicate that chloride ion concentrations at the deck surface are nearly ten times higher than the corrosion threshold for steel; however, they decrease rapidly to well below threshold at a depth of 3 inches below the surface.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, parapets, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joints will be removed. The top 2.25 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, a +/- 3 feet long portion of the concrete deck ends near the joints will be removed due to leakage and corrosion near the joints. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and

new armored and armorless joint systems will be installed as appropriate. The Level 1 Load Rating for the final condition was found to be acceptable.

Useful Life Expectancy

The removal of the top 2.25 inches of the existing deck will remove the portion of the deck with the highest chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. However, the rate of migration can be significantly reduced with the removal of the top of the deck with the highest chloride ion concentration of chloride ions. Additionally, concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative - 3 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative is similar to the 2 inches Bonded Concrete Overlay except the top 3.25 inches of the entire deck will be removed. This additional depth of concrete removal would bring the chloride concentrations of the remaining deck to well below the corrosion threshold for steel. Areas of deteriorated concrete will be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, a +/- 3 feet long portion of the concrete deck ends near the joints will be removed due to leakage and corrosion near the joints. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a nominal 3 inches thick bonded concrete overlay yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and new armored and armorless joint systems will be installed as appropriate. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    A concrete overlay will not completely prevent chlorides from penetrating through the overlay itself and into the structural deck, however, concrete admixtures will be included in the bonded concrete overlay to impede the penetration of chloride into the deck. This alternative will result in an extended useful life expectancy estimated at 30 years.

- Cost Estimate

  The estimated cost for this alternative is $6,097,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joints will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $7,551,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, parapets, fascias and bridge joints. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armored and armorless joints will be installed as appropriate. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

The estimated cost for this alternative is $8,319,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

REMARKS

GENERAL NOTE

Popli Design Group performed an In-depth Inspection of the I-481 Northbound bridge over Conrail - BIN 3/3 1093572. The field work began on 2/10/2014 and was completed on 3/25/2014. The inspection teams and their respective elements inspected are as follows:

- Inspection team of A. Thompson, P.E. - Team Leader; and M. Savino – Assistant Team Leader
  - underside elements:
    - begin abutment
    - piers 1 thru 10
    - superstructure span 1 thru span 10
    - fascias span 1 thru span 15
- Inspection team of G. Stam, P.E. – Team Leader; and T. Olmstead – Assistant Team Leader
  - topside elements:
    - begin abutment
    - deck span 1 thru span 15
    - superstructure span 1 thru span 15
    - end abutment
  - approach pavement and drainage near the bridge
  - underside elements:
    - piers 11 thru 14
    - superstructure span 10 thru span 15
    - end abutment

BEGIN ABUTMENT ITEMS

Begin Abutment - Joint with Deck:
The begin joint with deck is armored compression seal type (Photo 1). The armor angle is 1 inch wide and in good condition. The seal appears in good condition from above. There are concrete headers. The begin side header has a minor spall near centerline, a pattern of cracks at 1 foot to 3 foot intervals in the left lane (Photo 2) and a transverse crack in the right lane and right shoulder (Photo 3). Below, no signs of significant leakage were noted (Photos 4 and 5).

Begin Abutment – Bearings:
The begin bearings are expansion high rockers. Their position is close to neutral (Photo 6). The bearings are in good condition with some peeling paint and surface rust.

Begin Abutment - Seat and Pedestals:
There are stub abutments, therefore no seat. The pedestals are in good condition (Photo 5).

Begin Abutment – Backwall:
The backwall is in good condition with only isolated map cracking (Photo 4).

Begin Abutment – Stem:
There are stub abutments, therefore no stem.

END ABUTMENT ITEMS

End Abutment - Joint with Deck:
The end bearings are fixed. The steel armor at the end header was removed in 2003. There is no joint visible from the top and only a concrete transition header (Photo 7).

End Abutment – Bearings:
The end bearings are fixed and in generally good condition.

REMARKS

End Abutment - Seats and Pedestals:
There are stub abutments, therefore no seat. The top left and all three sides of pedestal P1 are hairline cracked (Photo 8). The top right has a crack emanating from the bearing anchor bolt and wraps down the right side (Photo 9). The anchor bolt is sound. The remaining pedestals are in good condition with no significant cracks or hollow areas detected.

End Abutment – Backwall:
There is tight hairline mapcracking with efflorescence throughout (Photo 10). At the left side of bay 2, there is a full height vertical crack with efflorescence (Photo 11). At the top of the right fascia bay, there is seepage down the backwall and mapcracking with efflorescence (Photo 12). The right cheek wall is cracked and stained with an 8 inches wide x 2 feet high x 1 inch deep spall (Photo 12).

End Abutment – Stem:
There are stub abutments, therefore no stem.

APPROACH ITEMS
Approach Drainage:
At the begin approach, the asphalt pavement along the curbline near the deck is slightly higher than the deck header trapping runoff and causing shallow ponding along the shoulders (Photos 13 & 3). Below, no signs of significant leakage were noted (Photos 4 and 5). There are no significant drainage issues evident at the end approach to the bridge.

Approach Settlement:
There is 0.5 inch of rutting of the asphalt pavement in the wheel paths of both lanes at the begin approach (Photos 1 & 14). There is no significant settlement at the end approach.

Approach Pavement:
The asphalt pavement at the begin approach is transverse cracked adjacent to the concrete joint header (Photo 1). At the end approach, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with up to 4 inches wide x up to 2 inches deep potholes along the concrete headers. (Photo 7)

DECK ITEMS
Deck - Wearing Surface:
All Spans: The ride quality of the deck is generally smooth except at several poorly patched areas where the patches are not flush with the adjacent deck surface (Photo 15). The wearing surface has transverse traction grooving that is worn smooth in the wheel paths in most spans (Photo 16).

Deck - Curbs:
All Spans: There are sloped face granite curbs embedded in the single sloped concrete parapets on both sides of the bridge. Generally, the curbs are in good condition. The only defects noted are:
- scattered locations where there is loose or missing mortar at the curb joints (Photo 17); and
- a 6 inches wide x 6 inches high missing piece of curb at the bottom right edge of the span 4 joint (Photo 18).

The original curb reveal was installed at 15.5 inches reveal. The average curb reveal for each span is as follows:

CURB REVEAL by SPAN	
Span No.	Curb Reveal (inches)
1	14.0
2	14.0
3	14.0

REMARKS

4	14.0
5	14.25
6	14.25
7	14.0
8	13.75
9	14.0
10	14.0
11	14.0
12	13.75
13	14.25
14	14.25
15	14.0

Deck – Sidewalks and Fascias:
Sidewalks – There are no sidewalks or safety walks on the bridge.

Fascias –
Typically, both fascias in all spans have scattered hairline cracking and staining throughout (Photo 19). There are scattered locations of cracks, staining, delaminations and spalls. Significant locations are noted below:

- Span 3 begin left fascia – at the begin above pier 2, the concrete is severely deteriorated with spalling 3 feet long x up to 6 inches deep with exposed reinforcement and crumbly concrete (Photo 20).
- Span 4 begin left fascia – at the begin above pier 3, the concrete is severely deteriorated with spalling 3 feet long x up to 6 inches deep with exposed reinforcement and crumbly concrete (Photo 21).
- Span 5 begin left fascia – at the begin above pier 4, the concrete is severely deteriorated with spalling 4 feet long x up to 6 inches deep with exposed reinforcement and crumbly concrete (Photo 22).

Deck – Railings and Parapets:
Railings - There is 3 square inch galvanized railing mounted on posts anchored on top of the concrete parapets (Photo 23). The anchor plates on the Span 2 left Posts 5 and 7 are slightly undermined due to parapet spalling (Photos 24 and 25). The railing is solid at these locations and the anchor bolts have sufficient embedment depth. The remainder of the railings are in good condition.

Parapets - In 2003, the concrete parapets received partial concrete repairs primarily to the top and top half of the inside face. The parapets exhibit extensive horizontal cracking with minor spalling along the cracks and scattered locations of staining of the inside face at 3 inches to 6 inches below the top of the parapet (Photo 26). Also, in the repair areas, there are locations of vertical cracking and scattered staining (Photo 23 & 17). The outside faces are also typically cracked with scattered locations of staining (Photo 27).

There are scattered areas of more extensive cracking, delamination and spalling with exposed reinforcement as noted below:

- Span 2 left – 1/3 span: 9’ long x 3.5” deep spall on top outside corner with exposed rebar (Photo 24); midspan: 11’ long x 3.5” deep spall on top outside corner with exposed rebar– (Photo 25). Loose chunks of concrete over the railroad tracks below were removed during this inspection.
- Span 4 left near 2/3 span – a location of severe cracks and a +/-3 feet long x up to 12 inches high x 2 inches deep spall on the inside top edge (Photo 28).
- Span 9 left near end span – spalled 2 feet long x 6 inches high x up to 2 inches deep along the inside top edge.
- Span 9 right near begin span – several pop-out spalls along the inside face. The worst is 6 inches in diameter x 1.5 inches deep with staining of the concrete below railing post #2 (Photo 29).
- Span 10 right near 1/3 span – several locations with 2 feet to 3 feet long x 8 inches high x 2.5 inches deep spalls along the inside top edge with exposed rusted reinforcement that is mostly bonded (Photo 30).
- Span 11 left near midspan – 1.5’ long x 1’ high x 2” deep spall at top outside corner (Photo 31).

REMARKS

- Span 14 left – 5' from begin: 1' dia. x 2" deep spall on outside face with horizontal cracking (Photo 32); near 1/3 span: 2' long x 3.5" deep spall on top outside corner with exposed rebar (Photo 33).
- Span 14 right near ¼ span – spalled 1 foot long x 3.5 inches deep x full width across the top and 2 feet long x 4 inches high x 2 inches deep along the inside edge (Photo 34).

SUPERSTRUCTURE ITEMS

Structural Deck:
Record plans indicate the original structural deck is 8 inches thick concrete mono-deck. SIP forms were used. Records indicate the deck was repaired, the surface was scarified and it received a 1.5 inch minimum concrete overlay in 1987. Curb reveal measurement would indicate a nominal existing deck thickness of 9.5 inches to 9.75 inches.

Top of Deck – There is extensive cracking with scattered hollow areas throughout as illustrated in the Top of Deck Deterioration Sketch. The deck in all spans except span 5 has tight mapcracking throughout except in concrete patched areas (Photo 35). The condition of patched areas is variable from good condition to poor condition with extensive cracking and spalling dependent upon the type of patch material used and quality of the patch. Many of the cracks and patched areas have been sealed with an epoxy or latex sealant (Photos 36 & 13). The total hollow and spalled area; and percent of deteriorated span surface are noted in the table below:

DECK DETERIORATION QUANTITIES

Span No.	Deteriorated Area (square foot)	Percent of Deteriorated Area
1	171.3	5.9
2	1113.3	21.0
3	1179.0	20.3
4	576.5	8.6
5	1.0	0.1
6	570.5	8.5
7	28.5	0.7
8	260.0	6.2
9	89.8	2.1
10	196.0	4.7
11	519.0	12.3
12	609.0	14.4
13	280.3	6.7
14	345.5	8.2
15	290.0	6.9
Total	6229.5	8.6

Significant locations of deterioration are noted below:

- Span 1 left lane – severely cracked with hollow areas throughout (Photo 36).
- Span 1 right lane – severely cracked with hollow areas near 1/3 span (Photos 37 & 38).
- Span 1 both lanes – there are rough patchwork repairs near the begin with cracking and shallow spalling along the perimeter of the patches (Photos 39 & 40).
- Span 2 left lane – extensive severe cracking with hollow sounding areas throughout the span.
- Span 2 right lane – scattered cracking and hollow areas.
- Span 3 left lane – extensive severe cracking with hollow sounding areas throughout the span.
- Span 3 right lane – scattered cracking and hollow areas.
- Span 4 left lane – heavy cracking and hollow areas in the end 2/3 span.

REMARKS

- Span 5 near end – 6 feet long x 1/8 inch wide crack at a construction joint near centerline (Photo 41).
- Span 5 right at span 4 joint – a 12 inches long x 12 inches wide x full deck depth spallbelow the curb at the far right edge of the span 4 joint with exposed debonded reinforcement (Photos 18 & 42).
- Span 6 both lanes – heavy cracking with hollow areas throughout.
- Span 6 left lane – patched area with cracks and 1 inch to 2 inches wide x 1 inch deep spalls along the cracks and along the edges of the patch (Photo 43).
- Span 7 right lane – scattered cracking and hollow areas.
- Span 8 both lanes – extensive transverse cracking throughout with hollow areas in the end half span.
- Span 9 both lanes – extensive transverse cracking throughout.
- Span 10 both lanes – extensive transverse cracking throughout.
- Span 11 both lanes – heavy cracking and hollow areas throughout.
- Span 12 left lane – severely cracked area throughout with a longitudinal crack in the left wheel path. Extensive hollow area in the end half span.
- Span 13 left lane – severely cracked with hollow areas throughout. There are rough patchwork of repairs near the end with cracking and shallow spalling along the perimeter of the patches (Photos 15 & 44).
- Span 13 right lane – moderately cracked with a patchwork of repairs in the end ½ span. Many of the patches are deteriorated with cracks and 1 inch to 2 inches wide x 1 inch deep spalls along the patch edges and cracks. The worst is near 2/3 span with a 2 feet long x 2 feet long x 2 inches deep spalled area (Photo 45).
- Span 14 left lane – extensive longitudinal cracking with scattered hollow areas in the begin ¼ and end ¼ spans (Photos 46 & 47).
- Span 15 both lanes – scattered transverse cracks and hollow areas throughout.

Underdeck – There are stay-in-place forms at the underside of the deck throughout (Photo 48). Typically, at the ends of the deck at the joints there is rusting of the SIP's indicating leakage of the joints or seeping at the headers (Photo 49). In each span, there is a 2.5 feet length of SIP that has been removed for inspection at the time of construction. Typically, the exposed deck and surrounding forms in these areas were in good condition except in span 13 girder bay 1 near the end where there was rusting at the edges of the SIP forms and transverse cracking with efflorescence (Photo 50). Additionally, there was rusting of the SIP forms along the top flanges of the interior girders in Span 12 near 2/3 span and near the end of span 13 indicating leakage through the deck (Photo 51).

Primary Members:
Generally, the primary members are in good condition with only surface rusting where the paint has blistered or peeled. More extensive peeling and blistering of the paint; and localized corrosion of the steel at the girder ends is evident near leaky superstructure joints. There is section loss to the bottom outside (left) web above the bearing to Girder 1 in Span 15 at the end (Photos 52 & 53). There is a 2 inches high band of corrosion above the bottom flange immediately to the begin of the outside web stiffener. Section loss readings taken by "D" meter show up to 53% percent localized section loss over a length of +/-3 inches. There are no significant section losses of the bearing stiffeners or inside of the web. Total section loss is 4% of the section above the bearing. There was no warping, crushing or other distortion evident at above the bearing.

Secondary Members:
Generally, the secondary members are in good condition with only surface rusting where the paint has blistered or peeled. More extensive peeling and blistering of the paint; and corrosion of the secondary member steel has occurred near leaky superstructure joints. Significant locations are noted below:

- Span 3 G2 – the bottom left gusset plate at the second last diaphragm is buckled and bowed upwards +/-1" (Photo 54). No cracks were found.
- Span 1 at end and Span 2 at begin – Rust, delamination, and +/-20% section loss to end diaphragm bottom chords and bottom gusset plates (Photo 55).
- Span 7 – bay 2 begin diaphragm – bottom chord angle deflected toward end 8" (Photo 56). Connections to the girders are intact. No cracks were found.

REMARKS

Paint:
The paint system is failed on 10% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges and scattered locations on the girder webs (Photo 57). The top of the outside bottom flanges are worst with 50% of the surface having blistered and peeling paint (Photo 58). There is 50% to 100% paint failure on end diaphragms and diaphragm gusset plates where leaky joints exist (Photo 55). There is surface rusting where the paint has peeled or blistered.

Joints:
There are three types of pier joints on the bridge. Spans 1, 2, 3, 4, & 5 are either 2.5 inch wide, or 11 inches x 6 inches wide steel angle armored open joints with below deck gutter system. Spans 6 thru span 14 are 1 inch wide steel angle armored compression seal joints. All joints appeared in generally good condition from above. Span 1 and the left lane of span 2 joints have elastomeric concrete headers. The span 1 begin side header is cracked in the wheel paths (Photo 59). The span 2 header in the right lane has a 1 foot to 3 feet wide pattern of cracking (Photo 60). The below deck joint gutters in Spans 1, 2, 3, 4, and 5 are filled with debris (Photo 61). The right side gutter system at the span 4 joint is leaking on the substructure elements below (Photo 62). The supports for the gutters have rust with minor section loss but are functioning properly (Photo 63). Typically, the steel angles and plates on the underside of the joints are heavily rusted with section loss and holes. The joints in Spans 6 thru 14 have their steel angles rusted away underneath exposing the underside of the headers which are moderately to heavily spalled throughout their lengths (Photos 64, 65, 66 and 67). At span 12 joint, the compression seal is leaking beneath the right curbline and leaking on the substructure elements below (Photo 68). At span 14 joint, the compression seal is leaking beneath the left curbline and leaking on the substructure elements below (Photos 69 & 70).

PIER ITEMS
Pier Bearings:
The begin row of bearings on each pier is fixed, and the end row is expansion. Typically, the bearings have peeling and blistering paint with light to heavy corrosion. The expansion bearings are high rockers and the typical condition is light to heavy pack rust with neutral to normally contracted rockers and some displacement at temperatures of 35° F to 4°F at the time of inspection. Specific conditions are noted as follows:

PIER HIGH ROCKER BEARING DATA

Pier No.	Bearing	Temp. (° F)	Tilt Angle (Degrees)	Tilt Direction	Rocker Displacement (Inch)	Rocker Displacement Direction	"X" Dimension (min. dist. between girders)	Photo No.
1	2 (1,3,4 Typ)	14	8.3	Contracted	0.25	Contracted	15.0	71
2	1	4	7.2	Contracted	0.5	Contracted	15.0	72
3	3	7	6.6	Contracted	0.5	Expanded	15.0	73
4	1	17	8.8	Contracted	0.5	Expanded	14.5	74
5	1	20	Not Taken		0.25	Contracted	Not Taken	75
6	1(3 less severe)	20	Not Taken		0.5	Contracted		76
6	2 (4 Typ)	10	7.7	Contracted	None		13	77
7	1	10	5.5	Contracted	0.25	Expanded	8.5	78
8	3 (1 and 2 Typ)	25	6.1	Contracted	None		8	79
8	4	25	7.7	Contracted	None		9	80
12	2	35	5.6	Contracted	None		8.625	81
13	3	35	5.6	Contracted	None		8.625	82

REMARKS

The bearing with the worst tilt condition was Pier 4 Bearing 1 (Photo 74). The tilt angle was 8.8° at 17°F. The allowable angle of tilt is 13.75° given the rocker should bear on the masonry plate within the middle 50% of the arch of the rocker. Several rockerswere displaced by 0.25 to 0.5 inches indicating the bearing is frozen and the rocker is "walking" rather than rotating or rocking. Displacement measurements were recorded at Piers 1-7. All of the rockers were entirely inside the masonry plate area.

Pier – Pedestals:
The pedestals had locations of cracked, hollow, and spalled concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

- Pier 4 pedestal P2 – 1.4 square foot x 5" deep spall with exposed rebar on begin face at top left (Photo 83). The spall does not undermine the bearing.
- Pier 5 pedestal P3 – right face at top has 3' long x 3" deep spall with exposed rebar (Photo 84). The remainder of the face is hollow. The begin face has 0.5 sf of hollowness and the end face has 1 sf of hollowness.
- Pier 5 pedestal P4 – full height x 2.5' long x 3" deep spall at begin right with exposed rebar (Photo 85).
- Pier 10 pedestal P4 – begin face at the top has a 6" x 3" x 1.5" deep spall.
- Pier 11 pedestal P1 – the left side is cracked with staining and 3 square foot area of hollow sounding concrete (Photo 86). The begin face and right side are cracked with 7 square foot area of hollowness (Photo 87).
- Pier 12 pedestal P1 – the end left is cracked 3 inches to 4 inches below the top edge (Photo 88). The begin face is similar.
- Pier 12 pedestal P4 – The right side is cracked (Photo 89). The begin face is cracked and has 2 square foot of hollowness (Photo 90); the end face is cracked with 1 square foot of hollowness.
- Pier 13 pedestal P1 – begin left top edge is cracked with 1 square foot of hollow sounding concrete (Photo 91).
- Pier 13 pedestal P3 – begin left side is cracked with 3 square foot of hollow sounding concrete (Photo 92).
- Pier 14 pedestal P1 – the left side and left half of the top are cracked with 2 square foot area of hollowness (Photo 93).
- Pier 14 pedestal P4 – the begin face is cracked with staining and 1 square foot area of hollowness (Photo 94).

Pier – Cap Beam:
The pier cap beam had locations of cracked, hollow, and spalled concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

- Pier 5 near column 3 – 5" deep spall at begin bottom corner with exposed rebar (Photo 95). The spall measures 17" high x 5' long on the begin face and 20" wide x 5' long on the bottom face; bottom face in this area is hollow for 4 square feet and cracked with efflorescence for 6 square feet.
- Pier 13 end right side – cracked with 8.5 square foot of hollowness and a 1 foot high x 2 feet long x 1.5 inches deep diagonal spall (Photo 96).
- Pier 14 begin right side – cracked with 8.5 square foot of hollowness (Photo 94).

Pier – Stem:
There are crash walls which are rated as pier stems at piers 2, 3, & 4. The pier stems at these piers had locations of cracked, hollow, and spalled concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

- Pier 3 – 5.1 square foot x 2.5" deep spall with exposed rebar on the begin face under Column 3 (Photo 97).
- Pier 4 – 15' long x 13" deep spall with exposed debonded rebar on the end top corner at the right (Photo 98). The remainder of the stem has 42 square feet of hollowness and locations of vertical cracking and tight map cracking.

REMARKS

Pier – Columns:
The pier cap beam had locations of cracked and hollow concrete as illustrated on the Pier Deterioration Sketches. Significant areas are noted below:

- Pier 5 column C1 – (5) spalls totaling 24.3 square feet (Photo 99). The spalls are mostly 3" deep and have exposed rebar.
- Pier 5 column C3 –11.5 square foot x 3" deep spall with exposed rebar on the right face at mid height (Photo 100).
- Pier 12 column C3 – the begin right side is cracked with 20 square foot area of hollowness (Photo 101). The right side of column C3 is cracked with staining and the end face is cracked with 24 square foot of hollowness (Photo 102).
- Pier 14 column C3 – the right side has vertical cracks with 5 square foot of hollowness; and the end left has 5 square foot area of hollowness (Photos 103 & 104).

Pier – General Concrete Condition:
There is scattered cracking with locations of hollow areas and spalled concrete throughout as illustrated in the Pier Deterioration Sketches. The total hollow and spalled area; and percent of deteriorated pier concrete surfaces are noted in the table below:

PIER CONCRETE DETERIORATION QUANTITIES

Pier No.	Deteriorated Area (square foot)	Percent of Deteriorated Area
1	8.3	0.8
2	59.8	3.3
3	29.1	1.6
4	106.8	5.9
5	89.4	5.9
6	14.4	0.9
7	22.7	1.7
8	29.9	2.3
9	12.1	0.9
10	16.9	1.4
11	45.25	3.6
12	62.8	5.4
13	25.1	2.4
14	44.7	4.8
Total	567.3	2.9

UTILITIES ITEMS
Lighting:
None.

Sign Structure:
None.

Utilities and Support:
None visible.

SPECIAL EMPHASIS ITEMS
Special Emphasis Inspection Required

- Non-Redundant/Fracture Critical Members – No

REMARKS

- Pin and Hangers – No
- Fatigue-Prone Welds – Yes
- Non-Categorized Fatigue-Prone Details – No
- Other – Yes

Special Emphasis Details

- Category 'D' welds at the ends 1'-0" radius at horizontal bracing gusset plates attached to bottom (tension) flanges of all girders in Spans 2 through 6.
- High rocker bearings at the begin abutment and at piers 1 thru 14.

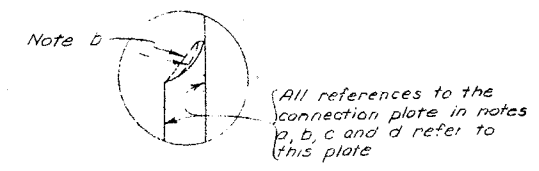
DETAIL "1



DETAIL "2

Note:
a. The connection plate shall be prepared and welded as a single bevel groove weld as shown in Detail #1. It shall then be Air Carbon-Arc gauged from the second side into sound weld metal and then welded as detailed. All welding shall be in the flat or "downhand" position.
b. The plate may be of any shape that will provide often welding, cutting, and finish grinding a smooth transition from the flange edge at a minimum radius of 12".
c. Both the connection plate and flange are to be the same type of steel.
d. Field welding to the connection plate will not be permitted.

LATERAL BRACING DETAILS
Not to Scale

The webs, flanges and gusset plates for bottom lateral bracing for the Span 3 girders shall be A.S.T.M. Designation A441 steel. Stiffeners, diaphragms, bearings, and bottom lateral bracing (except gusset plates) shall be A.S.T.M. A36 steel.

For additional details of bottom lateral bracing see drawing No. 22

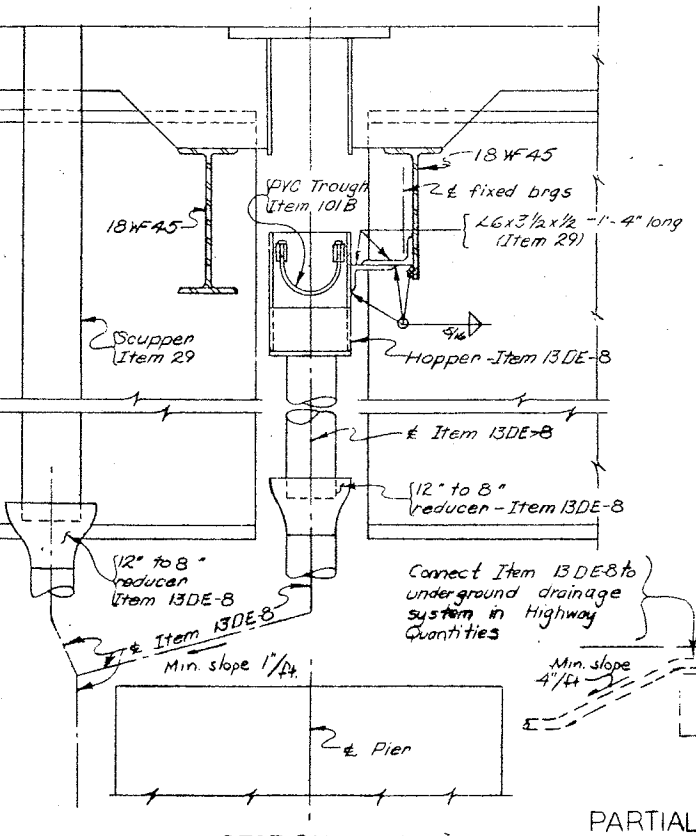
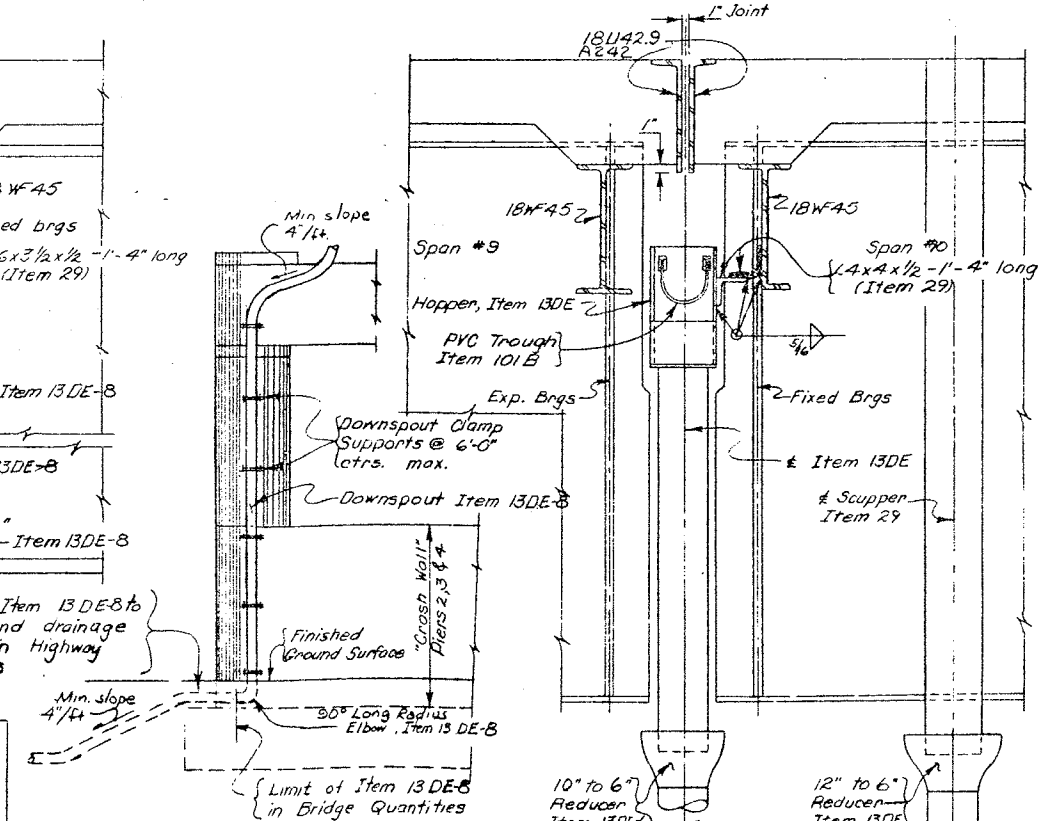
PLAN AT EAST END OF PIER "9 SOUTHBOUND
Scale : 1" = 1'-0"

** Adjust exact location of scuppers which drain into downspouts systems so as to accommodate the location of the downspouts.
Adjust exact location of scuppers which drain directly onto the ground so as not to spill on piers or onto diaphragms



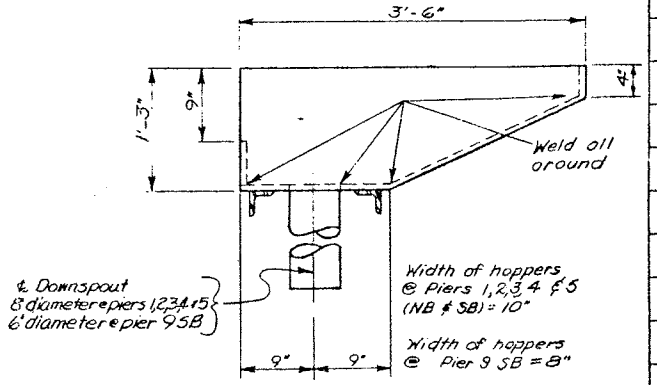
SECTION A-A
Scale : 1" = 1'-0"



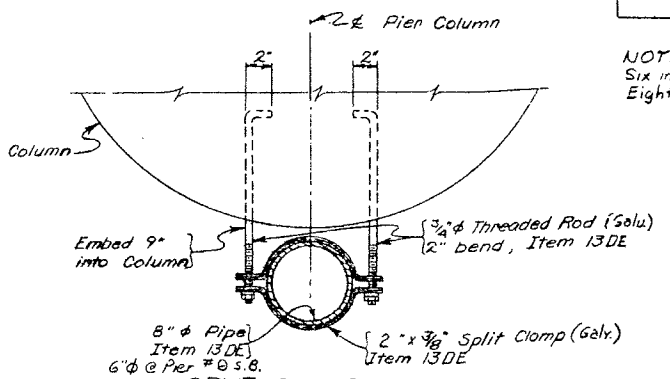
PARTIAL ELEVATION AT PIERS 1,2,3,4,5*,6 &7 (NB&SB)
Scale : 3/16" = 1'-0"

*No Hopper at Piers #6 ℄ #7 Downspout drains only the scupper.

SECTION B-B
Scale : 1" = 1'-0"



HOPPER ELEVATION
Scale : 1" = 1'-0"



SPLIT CLAMP DETAIL
Scale : 1½" = 1'-0"

Hoppers and downspouts (including all necessary pipe supports, hangers, and fittings) shall be paid for under Item 13DE-6 & Item 13DE-8.

Hopper shall be fabricated from steel plates, 3/8 inch thick, A.S.T.M. Designation A36 Steel. Hopper shall be galvanized after fabrication is complete in accordance with M19.

All bends in downspouts will be long radius bends. All indicated slopes on horizontal pipe runs will be the minimum allowed, and the long radius bends will be fabricated to take this slope into account. All costs involved will be included in the price bid for Item 13DE-6 & Item 13DE-8

WORK TO BE DONE ON BIN 1093571 SB: (NOT NECESSARILY IN THIS ORDER)

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION, (RR TRAFFIC CONTROL REQUIRED).
2. REMOVE EXISTING BRIDGE JOINTS AT THE BEGINNING ABUTMENT (TO INCLUDE ARMORING DECK ANGLE) AND PIERS #6, #7, #8, #10, #11 #12, #13 AND #14.
3. INSTALL NEW BRIDGE JOINTS, (MODULAR ONE-CELL JOINT SYSTEM).
4. INSTALL NEW COMPRESSION SEALS AT THE PARAPET SECTIONS OF THE EXISTING OPEN JOINTS, (PIERS #1, #2, #3, #4, #5 & #9). REPAIR EXISTING CONCRETE PARAPETS. OPEN JOINTS TO REMAIN.
5. REMOVE EXISTING ARMORING DECK ANGLE, AT END ABUTMENT.
6. REPAIR THE DECK AREA, WHERE ARMORING ANGLE WAS REMOVED.
7. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES.
8. REPAIR THE CONCRETE ELEMENTS (I.E. PIER CAPS, PIER COLUMNS AND PIER PEDESTALS).
9. PERFORM BEARING RESTORATION TO ALL EXPANSION BEARINGS (TO INCLUDE RESETTING OF UNDER EXTENDED BEARINGS).
10. REMOVE PIER CAP #4 AND #5, TO INCLUDE PEDESTALS AND BEARINGS.
11. CONSTRUCT NEW PIER CAPS AND PEDESTALS AT PIERS #4 AND #5.
12. PLACE NEW BEARINGS AT PIERS #4 & #5, (ELASTOMERIC BEARINGS).
13. CLEAN AND MODIFY EXISTING CLOSED DRAINAGE SYSTEM AT PIERS #1, #2, #3, #4, #5 AND #9.
14. INSTALL SCUPPER DOWNSPOUT EXTENSIONS AT EXISTING SCUPPERS, SPANS #7 THRU #14.
15. PERFORM DRAINAGE IMPROVEMENTS AT RR YARD.
16. REPAIR EXISTING CONCRETE PARAPETS.

P.I.N. 305613 | B.I.N. 1093571 & 1093572

GENERAL NOTES:

THE PROPOSED DRAINAGE WORK IS BASED ON DRAINAGE INFORMATION FROM ORIGINAL CONTRACT F.I.S.H. 70-7. REFER TO ORIGINAL CONTRACT PLANS FOR DETAILS OF EXISTING DRAINAGE STRUCTURES.

THE CONTRACTOR SHALL VERIFY THIS INFORMATION WITH FIELD SITE INSPECTIONS.

CONTRACTOR SHALL NOTE THAT ALL DRAINAGE SYSTEMS AND STRUCTURES SHALL BE CLEANED UNDER ITEMS 203.18M OR 203.19M.

THE EXACT PLACEMENT OF THE PROPOSED RR ACCESS ROAD (CONC. PIPE CULVERT) SHALL BE AT THE DISCRETION OF THE ENGINEER.

NO EXISTING SURVEY IS AVAILABLE, ITEM 625.01M "SURVEY & STAKEOUT" IS INCLUDED IN CONTRACT FOR ALL NECESSARY WORK, AS DIRECTED BY ENGINEER.

SEE DRAWING NO. DO17-3 FOR TABLE OF DRAINAGE WORK AND DITCH LINE WORK, TO BE DONE.

SEE DWG. NO. DO17-4 FOR DOWN-SPOUT MODIFICATION DETAILS.

SEE DWG. NO. GN-1 FOR SERIALIZED ITEM NOTES.

SEE DWG. NO. DO17-5 FOR PROPOSED CONC. PIPE AND MISCEL. DETAILS.

WORK TO BE DONE:

PIER #1 - CLEAN EXISTING DRAINAGE SYSTEM. PERFORM REPAIRS TO CONCRETE PIER ELEMENTS AND BEARING RESTORATION.

PIER #2 - DRAINAGE STRUCTURES AND DRAINAGE RUNS TO BE ABANDONED. MODIFY EXISTING DOWN-SPOUTS (REFER TO DRAWING NO. DO17-4 FOR DETAILS). CLEAN THE REMAINING DRAINAGE SYSTEM. THIS WORK SHALL INCLUDE EXTENSION OF THE EXISTING DITCH LINE AND INSTALLATION OF A CULVERT PIPE. ALSO CLEANING AND RESHAPING THE EXISTING DITCH LINE. PERFORM REPAIRS TO CONCRETE PIER ELEMENTS AND BEARING RESTORATION.

PIER #3 - DRAINAGE STRUCTURES AND DRAINAGE RUNS TO BE ABANDONED. MODIFY EXISTING DOWN-SPOUTS (REFER TO DRAWING NO. DO17-4 FOR DETAILS). CLEAN THE REMAINING DRAINAGE SYSTEM. THIS WORK SHALL ALSO INCLUDE CLEANING THE EXISTING DITCH LINE AND CLEANING EXISTING CULVERT PIPE. PERFORM REPAIRS TO CONCRETE PIER ELEMENTS AND BEARING RESTORATION.

PIER #4 - CLEAN EXISTING DRAINAGE SYSTEM TO INCLUDE ANY REPAIRS TO DRAINAGE STRUCTURES. NORTH BOUND, PERFORM REPAIRS TO CONCRETE PIER ELEMENTS AND BEARING RESTORATION. SOUTH BOUND, REPLACE PIER CAP.

PIER #5 - CLEAN EXISTING DRAINAGE SYSTEM TO INCLUDE ANY REPAIRS TO DRAINAGE STRUCTURES AND INSTALLATION OF A NEW OUTLET SECTION (405mm RCCP) NORTH BOUND, PERFORM REPAIRS TO CONCRETE PIER ELEMENTS AND BEARING RESTORATION. SOUTH BOUND, REPLACE PIER CAP.

PIER #6 (NB ONLY)- DRAINAGE STRUCTURES AND DRAINAGE RUNS TO BE ABANDONED. MODIFY EXISTING DOWN-SPOUTS (REFER TO DRAWING NO. DO17-4 FOR DETAILS). CLEAN REMAINING DRAINAGE SYSTEM. PERFORM REPAIRS TO CONCRETE PIER ELEMENTS AND BEARING RESTORATION. CONSTRUCT A SWALE TO DIRECT RUNOFF AWAY FROM PIER AND RR PROPERTY.

PIER #9 (SB ONLY) - CLEAN EXISTING DRAINAGE SYSTEM.

SEE DRAWING NO. GP17-2 AND GP17-3 FOR COMPLETE LISTING OF WORK TO BE DONE.

ALL DIMENSIONS ARE IN m UNLESS OTHERWISE NOTED

EXISTING PIER DOWNSPOUT

SCALE: 1 TO 10

PAINT REMOVAL NOTES:

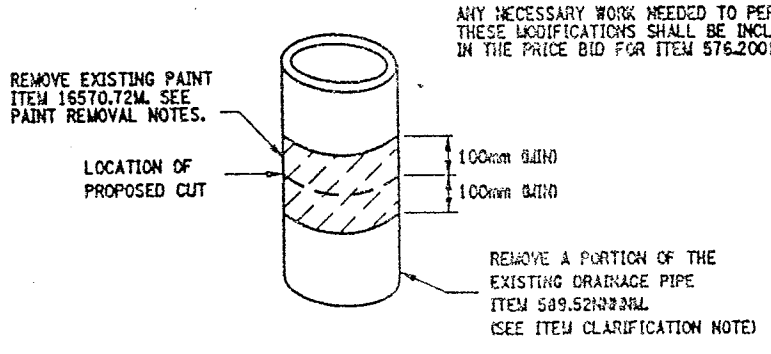
PAINT REMOVAL WORK SHALL BE DONE IN ACCORDANCE WITH REQUIREMENTS OF SECTION 741 OF STANDARD SPECIF.

REMOVE EXISTING PAINT FROM SPECIFIED ELEMENTS, PRIOR TO ANY CUTTING OR WELDING.

PAINT SHALL BE REMOVED TO 100mm MIN. FROM THE PROPOSED WELD/CUT LOCATON.

IN CONJUNCTION WITH THE USE OF ITEM 16570.72M - LOCALIZED VACCUM CONTAINED CLEANING OF STRUCTURAL STEEL. ITEM 570.09NNNNM - ENVIRONMENTAL GROUND PROTECTION AND ITEM 571.01NNNNM - TREATMENT AND DISPOSAL OF PAINT REMOVAL WASTE, SHALL ALSO BE INCORPORATED DURING PAINT REMOVAL OPERATIONS, (SEE ITEM CLARIFICATION NOTE, THIS SHEET).

THIS PAINT REMOVAL OPERATION SHALL BE REGARDED AS "EXEMPT SMALL GENERATOR STATUS" AND ALL PROVISIONS OF PART 372, 6 NYCRR SHALL APPLY .



LIMITS OF PAINT REMOVAL

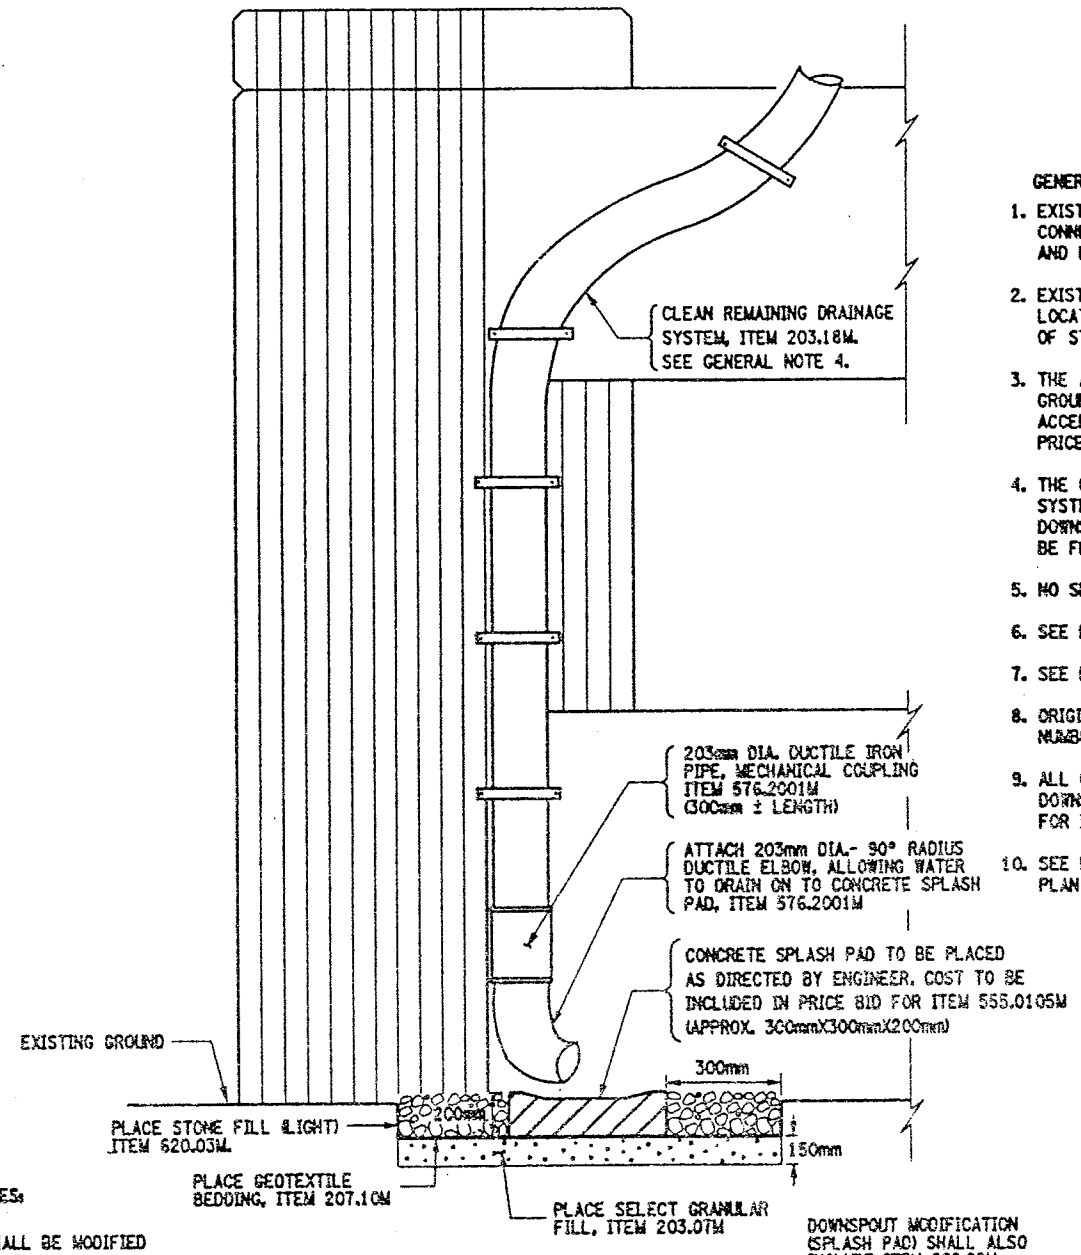
NOT TO SCALE

DOWNSPOUT MODIFICATION NOTES:

THE EXISTING DOWNSPOUTS SHALL BE MODIFIED AT THE FOLLOWING LOCATIONS:

PIER #2 NB AND SB	4 LOCATIONS
PIER #3 NB AND SB	4 LOCATIONS
PIER #6 NB	2 LOCTIONS
	10 LOCATIONS TOTAL

ANY NECESSARY WORK NEEDED TO PERFORM THESE MODIFICATIONS SHALL BE INCLUDED IN THE PRICE BID FOR ITEM 576.2001M.



DOWNSPOUT MODIFICATION (SPLASH PAD) SHALL ALSO INCLUDE ITEM 206.02M.

ALL PROPOSED COUPLINGS AND ELBOWS SHALL BE SHOP PAINTED, TO BE INCLUDED IN ITEM 572.010001M (572.010002M).

PROPOSED PIER DOWNSPOUT

SCALE: 1 TO 10

ITEMS USED:

ITEM 203.07M	- SELECT GRANULAR FILL, (CM)
ITEM 203.18M	- CLEAN CLOSED DRAINAGE SYSTEMS (m)
ITEM 206.02M	- TRENCH & CULVERT EXCAV. (CM)

ITEM 571.010002M	- TREATMENT & DISPOSAL OF PAINT REMOVAL WASTE (CM)
ITEM 572.010001M	- STRUCTURAL STEEL PAINT SYSTEM: SHOP APPLIED (SM)
ITEM 572.010002M	- STRUCTURAL STEEL PAINT SYSTEM: SHOP APPLIED (SM)
ITEM 589.520001M	- REMOVAL OF EXISITNG STEEL (EA)
ITEM 589.520002M	- REMOVAL OF EXISTING STEEL (EA)
ITEM 576.2001M	- DOWNSPOUT SYSTEM, DUCTILE IRON (m)
ITEM 620.03M	- STONE FILL, LIGHT (CM)

GENERAL NOTES:

1. EXISTING INLET DOWNSPOUT, ADJACENT DRAINAGE STRUCTURES AND CONNECTING DRAINAGE RUNS AT PIER #2 NB & SB, PIER #3 NB & SB AND PIER #6 NORTHBOUND ONLY, TO BE ABANDONED.
2. EXISTING DRAINAGE PIPE (DUCTILE IRON PIPE) SHALL BE CUT OFF AT LOCATION SHOWN OR AS DIRECTED BY ENGINEER. AS PER SECTION 589 OF STANDARD SPECIF. (SEE MODIFICATION NOTES).
3. THE ABANDONED INLET DOWNSPOUT PIPE (THE PORTION STILL IN THE GROUND) SHALL BE CAPPED WITH A DUCTILE IRON CAP, IN A MANNER ACCEPTABLE TO THE ENGINEER. ALL COSTS SHALL BE INCLUDED IN BID PRICE FOR ITEM 576.2001M.
4. THE CONTRACTOR SHALL NOTE THAT CLEANING THE DRAINAGE SYSTEM SHALL INCLUDE SCUPPERS, HOPPERS, TROUGHS AND DOWNSPOUTS. THE CLEANING OF THE DRAINAGE SYSTEM SHALL BE FROM THE BRIDGE DECK TO THE OUTLETTED DOWNSPOUTS.
5. NO SHOP DRAWINGS SHALL BE REQUIRED FOR DOWNSPOUT ELBOW.
6. SEE DRAWINGS NO. DD17-1 AND DD17-2 FOR MODIFICATION LOCATIONS.
7. SEE DRAWING NO. DD17-3 FOR TABLE OF DRAINAGE WORK TO BE DONE.
8. ORIGINAL CONTRACT PLANS F.I.S.H. 70-7 AND PREVIOUS CONTRACT NUMBER D251436.
9. ALL COSTS ASSOCIATED WITH THE INSTALLATION OF THE PROPOSED DOWNSPOUT ELBOW & COUPLING TO BE INCLUDED IN THE BID PRICE FOR ITEM 576.2001M.
10. SEE DRAWING NO. DD17-8 FOR MISC. DRAINAGE CLEANING DETAILS AND PLAN VIEW OF SPLASH PAD WITH STONE FILL.

ITEM CLARIFICATION NOTE:

ITEM 570.09NNNNM - ENVIRONMENTAL GROUND PROTECTION IS A SERIALIZED ITEM AND THE FOLLOWING PAY ITEMS SHALL BE INCORPORATED BY BRIDGE.

BIN 1093571 SB SHALL USE ITEM 570.090001M
BIN 1093572 NB SHALL USE ITEM 570.090002M

ITEM 572.01NNNNM - STRUCTURAL STEEL PAINT SYSTEM: SHOP APPLIED, IS A SERIALIZED ITEM AND THE FOLLOWING PAY ITEMS SHALL BE INCORPORATED BY BRIDGE.

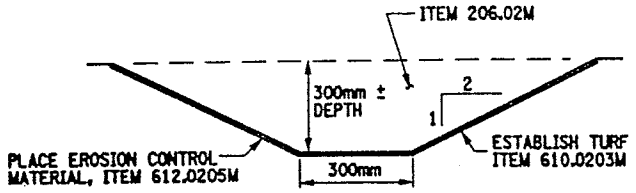
TYPICAL DITCH LINE NOTES:

1) SEE TABLE OF DITCH LINES DWG NO. D017-3.

2) DIMENSIONS SHOWN ARE FOR ROUGH CALCULATIONS.

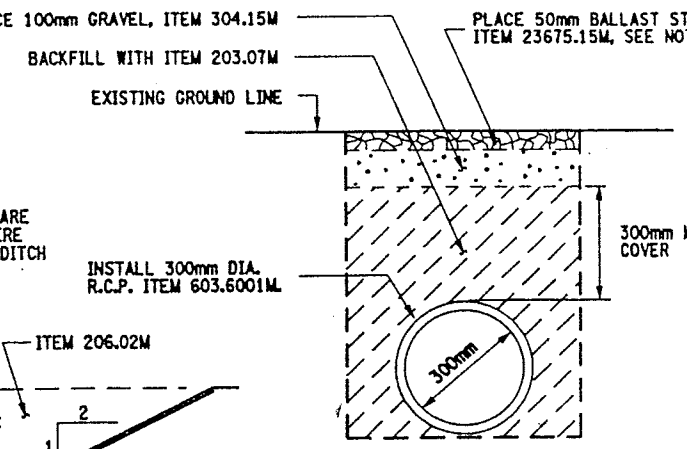
3) ITEMS 610.0203M AND ITEM 612.0205M ARE TO BE INCLUDE AT ALL LOCATIONS WHERE ITEM 15203.51M - CLEANING EXISTING DITCH LINES IS USED.



TYPICAL DITCH LINE

DITCH LINE EXTENSION AT PIER #2

NOT TO SCALE



PROPOSED CONCRETE PIPE SECTION X-X

NOT TO SCALE

CULVERT PIPE NOTES:

1) EXTEND EXISTING DITCH LINE FROM ITS CURRENT LOCATION (SEE DWG. NO. D017-1) APPROXIMATELY 20 METER EAST OF PIER #2. TO 5 METERS BEYOND PIER #2, WEST SIDE. THE COST TO BE PAID UNDER ITEM 206.02M. REFER TO "TABLE OF DITCH LINES" DWG. NO. D017-3 FOR DITCH LINE NUMBER #1.

2) INSTALL PIPE CULVERT TO PROVIDE RAILROAD (CSX) ACCESS TO PIER 2. THE EXACT LOCATION OF THE PROPOSED CULVERT SHALL BE DETERMINED BY THE ENGINEER.

3) THE PROPOSED CULVERT PIPE SLOPE TO MATCH THE SLOPE OF THE EXISTING DITCH LINE. NOTE, NO EXISTING SURVEY AVAILABLE, ITEM 625.01M, "SURVEY & STAKEOUT" IS INCLUDED IN CONTRACT. NO PROPOSED INVERT ELEVATIONS GIVEN.

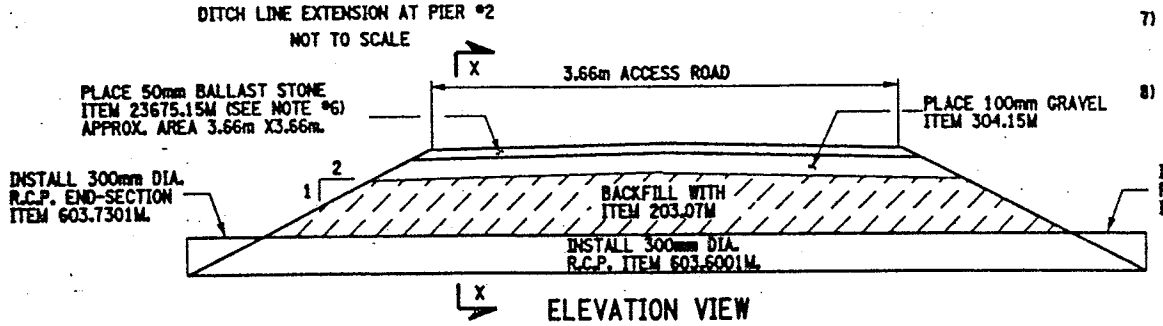
4) REFER TO NYS STANDARD SHEETS M203-4, M203-5 M203-6R1 AND M603-1.

5) NO LEAKAGE TEST REQUIRED.

6) FINISHED GRADE AT PROPOSED CULVERT INSTALLATION PLACEMENT OF ITEM 23675.15M, SHALL BE APPROVED BY CSXT DISTRICT ENGINEER. IF THIS MATERIAL DOES NOT SATISFY THE RAILROAD REQUIREMENTS FOR "APPROVED RAILROAD BALLAST STONE", THEN THE APPROPRIATE MATERIAL SHALL BE SUBSTITUTED FOR ITEM 23675.15M AT NO ADDITIONAL COST TO THE STATE.

7) THE CLASS & SIZE REQUIREMENTS FOR THE BALLAST STONE ITEM 23675.15M, SHALL BE DETERMINED BY THE ENGINEER.

8) INSTALLATION OF R.C.P. END-SECTIONS SHALL INCLUDE STONE FILL, ITEM 620.03M. (PLACED AT INLET & OUTLET OF RCP END- SECTIONS, AOBE).



ELEVATION VIEW

PROPOSED END-SECTION
END VIEW

NOT TO SCALE

END SECTION NOTES:

1) AT THE OUTLET OF DRAINAGE RUN #32 (SEE DWG. NO. D017-2) REMOVE EXISTING R.C.P. END-SECTION AND INSTALL A NEW CONCRETE PIPE END-SECTION, ITEM 603.7301M.

2) ANCHORING OF THE PROPOSED END-SECTION SHALL BE AS PER SECTION 603-3.06 OF STANDARD SPCIFICATIONS AND TO THE SATISFACTION OF THE ENGINEER. COST BE INCLUDED IN THE BID PRICE FOR ITEM 603.7301M.

3) THE ASSUMED GROUND ELEVATION IS TAKEN FROM THE DRAINAGE STRUCTURE TABLE ON DRAWING NO. D017-3 USING STRUCTURE #19 EXISTING T.G. ELEVATION. CONTRACTOR SHALL VERIFY ALL ELEVATIONS, ITEM 625.01M.

4) REFER TO NYS STANDARD SHEET M603-1.

5) INSTALLATION OF R.C.P. END-SECTION SHALL INCLUDE STONE FILL, ITEM 620.03M. (PLACED A.O.B.E.)

DRAINAGE STRUCTURE NOTES:

1) SEE DRAWING NO. D017-1 & D017-2 FOR DRAINAGE STRUCTURE LOCATIONS.

2) SEE DRAWING NO. D017-3 FOR TABLE OF DRAINAGE STRUCTURES, TO BE CLEANED OR ABANDONED.

3) REFER TO DRAWING NO. D017-4 FOR MODIFICATION OF DOWNSPOUT DETAILS.

SECTION C-C
NOT TO SCALE

JACKING NOTES:

THE METHOD OF LIFTING SHALL BE APPROVED BY THE DEPUTY CHEIF ENGINEER (STRUCTURES), DSES, TWO WEEKS PRIOR TO THE START OF THE WORK.

NO LIFTING WILL BE ALLOWED UNTIL ALL TEMPORARY SUPPORTS ARE SECURED.

WHEN POSSIBLE, THERE WILL BE NO LIVE LOAD DURING LIFTING.

LIFTING SHALL BE CONFINED TO ONE END OF A SPAN AT ANY ONE TIME.

IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER PIER (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARING), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN THE SPECIFICATION SECTION 585-STRUCTURAL LIFTING OPERATIONS.

WHERE THE CONTRACTOR IS REQUIRED TO PERFORM BEARING RESTORATION (SEE BR-11) AS WELL AS CONCRETE REPAIRS REQUIRING STRUCTURAL LIFTING, ONLY ONE STRUCTURAL LIFTING PAYMENT WILL BE MADE.

• PERFORM STRUCTURAL LIFTING UNDER ITEM 585.02M - STRUCTURAL LIFTING OPERATIONS - TYPE B (LIFTING AT A PIER) OR ITEM 585.03M - STRUCTURAL LIFTING OPERATIONS - TYPE C (LIFTING AT A PIER WHERE THE CONTRACTOR SHALL BE REQUIRED TO LIFT OFF THE FOOTING AND/OR GROUND LEVEL.

JACKING LOADS:

D.L. = 75 MT
L.L. = 50 MT
TOTAL = 125 MT

BRIDGE BEARING RESTORATION NOTES:

1. BRIDGE BEARING RESTORATION ITEM 15565.4302M SHALL INCLUDE ALL DESIGNATED WORK AS PER THE SPECIFICATION.
2. STRUCTURAL LIFTING SHALL BE USED WITH ALL EXPANSION BEARING RESTORATION.
3. IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER SPAN (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARINGS), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN SPECIFICATIONS SECTON 585-STRUCTURAL LIFTING OPERATIONS.
4. BEARING RESTORATION SHALL AS A MINIMUM, AND IN ALL CASES INCLUDE REPLACEMENT OF BRONZE PLATE.
5. FIXED BEARING TO BE CLEANED IN PLACE. DO NOT DISASSEMBLE.

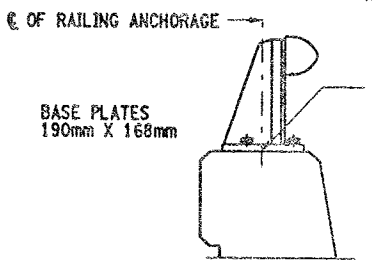
ASBESTOS MATERIAL REMOVAL NOTES:

THE REMOVAL OF ALL ASBESTOS CONTAINING CAULK (ITEM 210.5433M) SHALL BE COMPLETED PRIOR TO COMMENCEMENT OF ANY PARAPET REPAIR WORK.

THIS REMOVAL OF THE ASBESTOS CAULK SHALL BE PERFORMED AT EACH BRIDGE RAIL BASE PLATE ON BOTH N.B. & S.B. BRIDGES. (REMOVE ASBESTOS CALKING AT ALL RAIL BASE PLATES BOTH BRIDGES)

AFTER COMPLETION OF THE PARAPET REPAIRS INSTALL A CAULKING COMPOUND AROUND THE BASE PLATES OF THE RAILING WHICH MEETS MATERIAL SPECIF. 705-06 AND IS ACCEPTABLE TO THE ENGINEER. PAID UNDER ITEM 210.5433M.

REFER TO ORIGINAL CONTRACT PLANS F.I.S.H. 70-7 FOR RAIL LAY-OUT DETAILS.



REMOVE EXISTING GRAY ASBESTOS CAULKING COMPOUND AT THE ALUMINUM RAILING BASE PLATES, IT IS ASSUMED THAT THE CAULK COMPOUND IS SURROUNDING (PERIMETER) THE RAILING BASE PLATES. THIS PERIMETER REMOVAL OPERATION SHALL BE PERFORM AT EACH RAILING BASE PLATE ON BOTH STRUCTURES.

HOWEVER, SOME CAULK MATERIAL MAY BE FOUND UNDER THE RAILING BASE PLATES. THIS CAULKING COMPOUND UNDER THE BASE PLATES SHALL BE REMOVED ONLY AT LOCATIONS WHERE THE PARAPET CONCRETE REPAIRS WILL DISTRUB THE MATERIAL (REMOVAL AS ENCOUNTERED).

ALL COSTS TO BE PAID UNDER ITEM 210.5433M. SEE ASBESTOS MATERIAL REMOVAL NOTES, THIS SHEET.

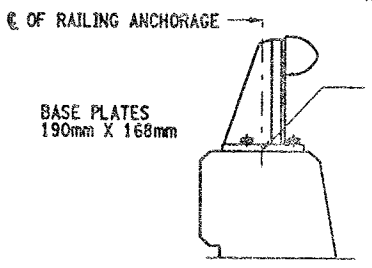
ASBESTOS MATERIAL REMOVAL NOTES:

THE REMOVAL OF ALL ASBESTOS CONTAINING CAULK (ITEM 210.5433M) SHALL BE COMPLETED PRIOR TO COMMENCEMENT OF ANY PARAPET REPAIR WORK.

THIS REMOVAL OF THE ASBESTOS CAULK SHALL BE PERFORMED AT EACH BRIDGE RAIL BASE PLATE ON BOTH N.B. & S.B. BRIDGES. (REMOVE ASBESTOS CALKING AT ALL RAIL BASE PLATES BOTH BRIDGES)

AFTER COMPLETION OF THE PARAPET REPAIRS INSTALL A CAULKING COMPOUND AROUND THE BASE PLATES OF THE RAILING WHICH MEETS MATERIAL SPECIF. 705-06 AND IS ACCEPTABLE TO THE ENGINEER. PAID UNDER ITEM 210.5433M.

REFER TO ORIGINAL CONTRACT PLANS F.I.S.H. 70-7 FOR RAIL LAY-OUT DETAILS.



REMOVE EXISTING GRAY ASBESTOS CAULKING COMPOUND AT THE ALUMINUM RAILING BASE PLATES, IT IS ASSUMED THAT THE CAULK COMPOUND IS SURROUNDING (PERIMETER) THE RAILING BASE PLATES. THIS PERIMETER REMOVAL OPERATION SHALL BE PERFORM AT EACH RAILING BASE PLATE ON BOTH STRUCTURES.

HOWEVER, SOME CAULK MATERIAL MAY BE FOUND UNDER THE RAILING BASE PLATES. THIS CAULKING COMPOUND UNDER THE BASE PLATES SHALL BE REMOVED ONLY AT LOCATIONS WHERE THE PARAPET CONCRETE REPAIRS WILL DISTRUB THE MATERIAL (REMOVAL AS ENCOUNTERED).

ALL COSTS TO BE PAID UNDER ITEM 210.5433M. SEE ASBESTOS MATERIAL REMOVAL NOTES, THIS SHEET.

NOTES:

THE CONTRACTOR SHALL SUPPLY MULTI-ROTATIONAL STRUCTURAL BRIDGE BEARINGS CONFORMING TO THE REQUIREMENTS OF STANDARD SPECIFICATION SECTION 565 AND SUBJECT TO THE FOLLOWING CONDITIONS:

1. THE BEARING DEVICES SUPPLIED SHALL BE CAPABLE OF TRANSMITTING THE LOADS AND MOVEMENT SHOWN ON THESE PLANS.
2. THE DIMENSION "H" IN THE BEARING TABLE REPRESENTS THE ASSUMED TOTAL HEIGHT OF BEARING MECHANISM BETWEEN THE SOLE PLATE AND MASONRY PLATE USED BY THE DESIGNER TO ESTABLISH THE PEDESTAL ELEVATIONS. THE MINIMUM PEDESTAL HEIGHT SHALL NOT BE CHANGED WITHOUT WRITTEN APPROVAL OF THE DEPUTY CHIEF ENGINEER (STRUCTURES).
3. MASONRY PLATES ARE TO BE DESIGNED. THE MINIMUM CONCRETE EDGE DISTANCE SHALL BE 75 mm AND THE MINIMUM ANCHOR BOLT COVER SHALL BE 200 mm.
4. THE BEARING DEVICE, MASONRY PLATE, SOLE PLATE, ANCHOR BOLTS, NUTS, WASHER PLATES AND BEARING PAD SHALL BE INCLUDED IN THE UNIT PRICE BID FOR THE BEARING ITEMS.
5. ALL EXPANSION BEARINGS SHALL HAVE A MAXIMUM FRICTION COEFFICIENT OF 3%.
6. IF THE ANCHOR BOLTS ARE SET UNDER THE SOLE PLATE, A MINIMUM CLEARANCE EQUAL TO TWO TIMES THE THICKNESS OF ANCHOR NUT PLUS 25 mm SHALL BE MAINTAINED BETWEEN THE TOP OF MASONRY PLATE AND BOTTOM OF THE SOLE PLATE.
7. ALL STEEL SHALL CONFORM TO ASTM A588M.
8. ALL METAL COMPONENTS OF THE BEARING SYSTEM WHICH ARE LIABLE TO COME INTO CONTACT DURING THE TRANSLATION SHALL HAVE A TEFLON SLIDING SURFACE FINISH.
9. ALL STEEL FABRICATION SHALL CONFORM TO THE PROVISIONS OF THE LATEST EDITION OF THE NEW YORK STATE STEEL CONSTRUCTION MANUAL.

WHENEVER JACKING OF THE SUPERSTRUCTURE IS NEEDED TO RESET THE BEARINGS, THE CONTRACTOR SHALL SUBMIT A JACKING SEQUENCE TO THE E.I.C. FOR APPROVAL.

LIST OF ITEMS USED:

ITEM 565.1522M - TYPE M.R. EXPANSION BEARING (1001 TO 2000KN) (EA)
ITEM 565.1722M - TYPE M.R. FIXED BEARING (1001 TO 2000KN) (EA)

*ONE WAY LONGITUDINAL MOVEMENT IS THE MAXIMUM ONE WAY MOVEMENT (EXPANSION OR CONTRACTION) OF THE SUPERSTRUCTURE WHEN BEARINGS ARE SET @ 20°C PLUS 25 MILLIMETERS OF TOLERANCE.

**ON WIDE STRUCTURES AND ON CURVED STRUCTURES PROVISIONS SHALL BE MADE FOR LIMITED LATERAL MOVEMENT.

PAINT REMOVAL DETAIL

SCALE: 1 TO 5

PAINT REMOVAL NOTE:

1. IN CONJUNCTION WITH THE USE OF ITEM 16570.32M AND ITEM 16570.76M. ITEM 571.01NNNNM - TREATMENT & DISPOSAL OF PAINT REMOVAL WASTE AND EITHER ITEM 570.10NNNNM - ENVIRONMENTAL GROUND PROTECTION OR ITEM 570.09NNNNM - ENVIRONMENTAL WATER PROTECTION SHALL ALSO BE INCORPORATED DURING THE PAINT REMOVAL OPERATIONS.
2. ALL NEW PARTS INSTALLED AT THIS LOCATION SHALL BE INCLUDED IN THE UNIT PRICE BID FOR ITEM 15565.4302. THE CONTRACTOR WILL BE PAID FOR A QUANTITY OF ONE FOR ALL NEW MATERIALS AT THIS LOCATION.
3. ALL EXISTING SURFACES SHALL BE CLEANED AND LUBRICATED TO ENSURE FREE MOVEMENT, ITEM 15565.4302M.

LIST OF ITEMS USED:

ITEM 571.010001M - TREATMENT AND DISPOSAL OF PAINT REMOVAL WASTE (CM)
ITEM 571.010002M - TREATMENT AND DISPOSAL OF PAINT REMOVAL WASTE (CM)
ITEM 15565.4302M - BRIDGE BEARING RESTORATION (EA)

BRIDGE BEARING RESTORATION NOTES:

1. BRIDGE BEARING RESTORATION ITEM 15565.4302M SHALL INCLUDE ALL DESIGNATED WORK AS PER THE SPECIFICATION.
2. STRUCTURAL LIFTING SHALL BE USED WITH ALL EXPANSION BEARING RESTORATION.
3. IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER SPAN (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARINGS), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN SPECIFICATIONS SECTON 585-STRUCTURAL LIFTING OPERATIONS.
4. BEARING RESTORATION SHALL AS A MINIMUM, AND IN ALL CASES INCLUDE REPLACEMENT OF BRONZE PLATE.
5. FIXED BEARING TO BE CLEANED IN PLACE. DO NOT DISASSEMBLE.
6. ON BINS 1093571 & 1093572, BRIDGE BEARING RESTORATION ITEM 15564.4302M FOR THE HIGH ROCKER BEARINGS SHALL INCLUDE ONLY THOSE BEARINGS SHOWN ON DWG BR-11 WHICH ARE EITHER OVER EXTENDED OR UNDER EXTENDED MORE THAN 5° FROM WHAT SHOULD BE ANTICIPATED FOR THE AMBIENT TEMPERATURE. THOSE EXPANSION BEARINGS WHICH ARE BEING RESTORED SHALL BE RESET TO ORIGINAL SPECIFICATIONS.

JACKING NOTES:

THE METHOD OF LIFTING SHALL BE APPROVED BY THE DEPUTY CHEIF ENGINEER (STRUCTURES), DSES, TWO WEEKS PRIOR TO THE START OF THE WORK.

NO LIFTING WILL BE ALLOWED UNTIL ALL TEMPORARY SUPPORTS ARE SECURED.

WHEN POSSIBLE, THERE WILL BE NO LIVE LOAD DURING LIFTING.

LIFTING SHALL BE CONFINED TO ONE END OF A SPAN AT ANY ONE TIME.

IF THE CONTRACTOR ELECTS TO LIFT ONLY ONE GIRDER AT A TIME PER PIER (TO A MAXIMUM OF 3 mm TO REMOVE LOAD FROM BEARING), NO VEHICULAR TRAFFIC RESTRICTIONS WILL BE REQUIRED AS STATED IN THE SPECIFICATION SECTION 585-STRUCTURAL LIFTING OPERATIONS.

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 North Bound Bridge over Conrail. Based on laboratory analyses of bulk samples collected, the following materials were determined to contain asbestos:

BIN 1-09357-2 Interstate Route 481 North Bound over Conrail

Type of Material	Estimated Amount
Sheet Packing	7 Square Meters
Caulking Compound	45.7 Linear Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 North Bound Bridge over Conrail (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09357-2 Interstate Route 481 North Bound over Conrail

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 7 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Caulking Compound

Asbestos-containing caulking compound is located around some of the guide rail base plates on both parapets on the bridge. It is estimated that the total amount of this caulking compound is approximately 45.7 linear meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this material are shown in the attached FIGURE 2. Analytical results of bulk samples collected are summarized in the attached TABLE.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

2013 - Upper approximate 1.5' bands along the right and left concrete parapets (above the sloped granite portion) have several areas of rust staining, cracking and spalling with exposed corroded reinforcement on the top surface and inside and outside faces in all spans (Photos 4, 7, 8, 45 & 58). Cracks typically have occurred approximately 6" below the top and in the areas surrounding previous concrete patches. There are several up to 1/8" open longitudinal cracks throughout, but the parapets are sufficiently solid for vehicular impact (Photo 7).

Note ID: 3A1310935720008

Span 001 -- Superstructure: Structural Deck -- Rated 5, Was 4

Referenced Photos: "5"
2013 - The underside of the structural deck at the begin of Span 1 has rusted stay-in-place forms indicating that water is leaking through the bridge deck in this isolated area. A section of corrugated stay-in-place forms has also fallen in this area exposing the underside of the concrete deck with light cracking and efflorescence. However, this condition alone is not sufficiently detrimental to warrant a rating lower than '5' for this item. Remaining areas of the structural deck in Span 1 are in better condition.

2013 - The bottom flanges of exterior portions of both fascia girders have significant paint loss with rust, flake rust and corrosion (Photos 16 & 62). Section loss is minimal. Fascia girder webs have spotty areas of paint failure and rust (Photo 47). Interior girders have peeling paint and paint deterioration, mainly along bottom flanges and especially in areas beneath superstructure joints (Photo 48). Extensive rust and corrosion have developed on pier bearings, bearing stiffeners, connection plates and cross-bracing over piers (Photos 9, 10, 17, 31 & 43).

2013 - All high rocker bearings were under/over-extended for the ambient air temperature on the day of inspection. The bearings that were under-extended and in similar condition are at Piers 1, 2, 3, 4, 6, 7, 8, 10 & 11 (Photos 23, 40 & 44). Most bearings were under-extended between approximately 3 degrees and 5 degrees. Bearing 4 at Pier 8 had the worst under-extension at approximately 8 degrees (Photo 44).

Fixed Bearing 2 on Pier 7 is not stitch welded. It is welded on both sides with the begin and end unwelded.

Minor to moderate pack rust has developed beneath the rockers of all high rocker bearings on all piers (Photos 11, 40, 41, 44 & 53). Remaining areas of both fixed and expansion pier bearings have minor to moderate peeling paint with rust and minor corrosion (Photos 23, 40, 44 & 53).

2013 - Scuppers in Spans 2 through 15 are typically partially or completely plugged with sand and roadway debris (Photo 21). In addition, downspout hoppers are typically plugged up to 3/4 full with sand and roadway debris (Photo 29).

Piers with original steel downspouts and those with new PVC downspouts are summarized on the attached Scupper Downspout Documentation. Original ductile iron downspouts have peeling paint, rust and corrosion. The original downspout at Pier 5 has also separated at a joint (Photo 30). New PVC downspouts would rate '7' alone (Photo 46).

Span 014 -- Pier: Pedestals -- Rated 4, Was 4

Referenced Photos: "12", "24", "33", "34", "49", "56"
2013 - Pedestals are cracked with rust staining at Piers 2, 4, 5, 11, 13 & 14 (Photos 12 & 49). Fascia pedestals are cracked and hollow sounding with rust staining at Piers 2, 11, 13 & 14 (Photos 12, 49 & 56).

Severe spalling with exposed corroded reinforcement has occurred on Pedestal 2 at Pier 4 (Photo 24) and Pedestals 3 & 4 at Pier 5 (Photos 33 & 34). Bearing contact area has not been affected at these pedestals.

Remaining pedestals at all piers would rate '5' or '6' alone.

Note ID: 3A131093572000D

Span 002 -- Pier: Stem Solid Pier -- Rated 4, Was 5
Span 003 -- Pier: Stem Solid Pier -- Rated 4, Was 4
Span 004 -- Pier: Stem Solid Pier -- Rated 4, Was 4

Referenced Photos: "13", "25", "18", "26"
2013 - Solid pier stem crash walls at Piers 2, 3 & 4 were rehabilitated in the past, but currently have open cracking and large scale map cracking (shrinkage cracking) with isolated areas of efflorescence and minor rust staining (Photos 13, 18, 25 & 26).

The solid pier stem crash wall at Pier 3 has severe deterioration with efflorescence, rust staining and exposed corroded reinforcement at the right end of the begin face (Photo 18). The spalling is up to 1" deep on an area approximately 2.5' wide and 1.5' high.

The right portion at the top of the end face of the solid stem of Pier 4 is severely

Note ID: 3A131093572000D - continued

deteriorated and spalled with exposed corroded reinforcement along almost the entire length between the columns (Photo 26). The spalled area is approximately 1' high by 1' deep completely exposing the reinforcement cage. It appears that this was the same area that was repaired during the last contract because it is spalled along the sawcut line.

Note ID: 3A131093572000E

Span 002 -- Pier: Cap Beam -- Rated 4, Was 5
Span 004 -- Pier: Cap Beam -- Rated 5, Was 5
Span 005 -- Pier: Cap Beam -- Rated 4, Was 4
Span 013 -- Pier: Cap Beam -- Rated 4, Was 4

Referenced Photos: "14", "27", "35", "57"
2013 - Cap beams at Piers 2, 4, 5 & 13 have areas of dampness, cracking, efflorescence, rust staining and severe deterioration and spalling with exposed corroded reinforcement. Most cracking with efflorescence has occurred on the undersides of these cap beams (Photos 14, 27 & 35). The worst area has occurred on the underside and lower portion of the begin face of the Pier 5 cap beam (Photo 35). This spalled area is up to 3" deep and has occurred in the right portion for approximately half the length of the cap beam between the pier columns (Photo 35). It appears that this was a previously patched area.

A delaminated and hollow sounding area approximately 1.5' in diameter has occurred at the right end of the end face of Pier 13 beneath Pedestal 4 (Photo 57).

The condition of the Pier 4 cap beam is not sufficiently detrimental to warrant a rating lower than '5'.

Remaining areas of cap beams at Piers 2, 5 & 13 are in better condition and would rate '5' alone.

Note ID: 3A131093572000F

Span 002 -- Pier: Pier Columns -- Rated 4, Was 4
Span 004 -- Pier: Pier Columns -- Rated 4, Was 5
Span 005 -- Pier: Pier Columns -- Rated 4, Was 4
Span 007 -- Pier: Pier Columns -- Rated 4, Was 4
Span 011 -- Pier: Pier Columns -- Rated 4, Was 4

Referenced Photos: "15", "28", "36", "37", "42", "50"
2013 - The begin face at the base of Column 2 of Pier 2 is map cracked and has hollow sounding concrete in the area adjacent to a previously patched area (Photo 15).

The right face of Column 3 of Pier 4 is map cracked and rust stained and has hollow sounding concrete in the area adjacent to a previously patched area (Photo 28).

Column 1 of Pier 5 has severe deterioration and spalling with exposed corroded

Note ID: 3A1310935720000F - continued

reinforcement in the lower portion of the column (Photo 36). This column is spalled around the begin face approximately 1' wide at a height of approximately 4' and the spalling extends to ground level on the left side (Photo 36). Both stirrups and vertical reinforcement are exposed. Cracking with efflorescence has also occurred at the begin right of this column adjacent to the downspout (Photo 37).

The right portion of the begin face of Column 1 of Pier 7 has cracking and hollow sounding concrete near the top (Photo 42).

The end face of Column 3 of Pier 11 is hollow sounding on approximately 15% of the face (Photo 50).

Remaining areas of pier columns at Piers 2, 4, 5, 7 & 11 are in better condition and would rate '5' alone.

Note ID: 3A1310935720005

Span 003 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Span 004 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Span 005 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Referenced Photos: "19", "20"
2013 - The left concrete fascia at superstructure joints at Piers 2, 3 & 4 have severe deterioration and spalling with exposed corroded reinforcement (Photo 19). The spalls extend to the underside of the fascia concrete at the begin left of Spans 3 & 4 and the begin left and begin right of Span 5 (Photo 20).

Remaining areas of the right and left fascias in Spans 3, 4 & 5 would rate '5' alone.

Note ID: 3A1310935720000

End Abut -- Abutment: Backwall -- Rated 5, Was 5
Referenced Photos: "59"
2013 - A full height vertical crack with efflorescence has developed in Bay 2 of the end abutment backwall. Remaining areas of the end abutment backwall would rate '6' alone.

Note ID: 3A1310935720001

End Abut -- Wingwalls: Walls -- Rated 4, Was 4
Referenced Photos: "60", "61"
2013 - The end right cheek wall has map cracking, cracking with efflorescence and minor rust staining on the right face (Photo 60). In addition, there is an approximate 1.5' diameter spalled area at the top of the begin face (Photo 61). The concrete is otherwise solid. The end left cheek wall would rate '5' alone.

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 481I 481I33012069 Crossed: CSX TRANS/AMTRAK CheckValue: 1,866,324,811

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - Yes
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

2013 - A 100% hands-on inspection was performed on all special emphasis details.

Category 'D' welds at the ends of 1'-0" radius gusset plates attached to bottom (tension) flanges of exterior and first interior girders in Spans 2 through 6 and in Span 10 as shown on Sheets 21, 22 & 26 of the plans.

General Notes To the Next Inspector:

2013 - A CSX Railroad Flagman is required for access to Spans 1 - 5 for use of a 60' UBIU and for access
to Piers 1 to 4.
Access to Spans 6 - 15 from above is with a 60' UBIU.
Access to Spans 6 - 15 from below is through a CSX rail yard gate and along a maintenance road between the two I481 bridges.

The bridge is at CSX Railroad Milepost QC 285.23.

The BIN Plate is mounted on the begin right wingwall.

Improvements Observed:

2013 - None

Inspection Date: 7/9/2013 RC: 33 BIN: 1093572

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JUNE 10, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093572 (I-481 Northbound / CSX Trans/Amtrak)

This memorandum summarizes the seismic screening conducted for BIN 1093572 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Seat width improvements are required at piers. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: JULY 1, 2014

RE: FATIGUE EVALUATION
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093572 (I-481 Northbound / CSX Trans / Amtrak)

This memorandum documents a fatigue evaluation conducted for the existing Interstate 81 Viaduct Project. Existing structures with AASHTO Category D, E, and E' fatigue-prone details require 100% hands-on inspection unless proven to be exempt. The purpose of the evaluation is to assess the remaining life of fatigue-prone components.

EVALUATION PROCEDURES

The fatigue evaluation was performed in accordance with the AASHTO Guide Specification for Fatigue Evaluations of Existing Steel Bridges, 1990. Fatigue-prone welds identified in the biennial inspection reports were located on record drawings and confirmed visually in the field. Additional information concerning fatigue-prone welds located in BIN folders was also obtained and reviewed prior to inspection.

EVALUATION RESULTS

The results of the fatigue evaluation of the existing bridge are shown below.

Fatigue Detail Location	Remaining Safe Fatigue Life (Years)
Interior Girders, End of Bottom Flange Cover Plate	Infinite
Exterior Girders, End of Bottom Flange Cover Plate	Infinite

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged surface area of the deck for the bridge averages 8.6% and varies by span ranging between 0.1% and 21.0% of the deck surface area. The cores indicate the reinforcement steel is 3.25 inches to 4.5 inches below the surface of the deck. Additionally, the cores indicate the reinforcement steel is epoxy coated. The core lab tests indicate that chloride ion concentrations at the deck surface are nearly two times higher than the corrosion threshold for steel; however, they decrease rapidly to well below threshold at a depth of 3 inches below the surface.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inch Bonded Concrete Overlay
    - The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. This alternative will result in an estimated extended useful life expectancy of 20 years.

  The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative - 3 inch Bonded Concrete Overlay
    - Scope

      The scope of this alternative is similar to the 2 inch Bonded Concrete Overlay except the top 3.25 inches of the entire deck will be removed and will include the complete removal of the bridge railings, curbs, parapets, and fascias to the level of the original top of the deck. This additional depth of concrete removal would bring the chloride concentrations

of the remaining deck to well below the corrosion threshold for steel. Areas of deteriorated concrete will be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, a +/- 3 feet long portion of the concrete deck ends near the joints will be removed due to leakage and corrosion. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a nominal 3 inches thick bonded concrete, yielding a 9.5 inch standard thickness deck. A new single-sloped concrete barrier and new armored and armorless joint systems will be installed as appropriate. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  A concrete overlay will not completely prevent chlorides from penetrating through the overlay and into the structural deck, however, concrete admixtures will be included in the bonded concrete overlay to impede the penetration of chloride into the deck. This alternative will result in an estimated extended useful life expectancy of 30 years.

- Cost Estimate

  The estimated cost for this alternative is $6,983,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curbs, parapets, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joints will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6 inch thick concrete deck, yielding a 9.5 inch standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

  - Useful Life Expectancy

This alternative will provide an estimated extended useful life expectancy of 35 years.

- Cost Estimate

  The estimated cost for this alternative is $8,424,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, parapets, fascias and bridge joints. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armored and armorless joints will be installed as appropriate. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide an estimated extended useful life expectancy of 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $8,763,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide an estimated extended useful life expectancy of 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

ITEM	REMARKS	PHOTO N0.
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: The begin bearings are fixed. The steel armor was removed in 2003. There is no joint visible from the top (Photo 1). Under the deck, the pad at the top of the backwall has "walked" and is hanging down in bays 3, 4, & 5 (Photo 2). There is evidence of leakage down the backwall in bays 1, 5, & 6 (Photos 3 & 4)	1,2,3,4
TP 349-24	Begin Abutment – Bearings: The begin bearing are fixed. All of the bearings have pack rust between the rocker and the masonry plate that restricts movement. The fascia bearings G1 and G7 are the worst (Photos 5 & 6). The outboard anchor bolts of the fascia bearings are missing (Photos 5 & 6)	5,6
TP 349-26	Begin Abutment - Seat and Pedestals: The seat and pedestals are in good conditions with no hollow areas or significant cracks detected.	
TP 349-28	Begin Abutment – Backwall: At the left and right sides and in girder bays 1 and 6, there is tight map cracking with dampness and efflorescence staining from leakage down the backwall (Photos 3, 4, & 7). There is a full height hairline crack behind girder 4 (Photo 8).	3,4,7,8
TP 349-30	Begin Abutment – Stem: The stem has been recently repaired, cleaned and a surface sealant applied. No hollow areas or significant cracks were detected. (Photo 9). See Begin Abutment Deterioration Sketch.	9
TP 349-32	Begin Abutment – Erosion: The paving block slope protection at the right side is deteriorated with settled and deteriorated blocks over a 20 square foot area (Photo 10).	10
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end joint is steel armored compression seal type and is in good condition (Photo 11). There is shallow ponding of water at the left and right curbs at the joint (Photo 12) indicating the seals remain water tight, although there is staining of the end abutment stem indicating the end joint may be leaking (Photo 13) . The concrete headers are in generally good condition with only minor spalling of the concrete along the steel armor angle and the end edge. The end side header at the end is cracked near centerline (Photo 11); and the begin side header at the end left safety walk is cracked along the steel angle (Photo 14).	11,12,13, 14
TP 349-25	End Abutment – Bearings: The end bearings are expansion. The fascia bearings are rusted and may have restricted movement (Photo 15). All of the bearings are slightly extended at 40 ºF with the end of the sole plate at the back edge of the masonry plate (Photo 16)	15,16

ITEM	REMARKS	PHOTO N0.
TP 349-27	End Abutment - Seats and Pedestals: The seats and pedestals are in good conditions with no hollow areas or significant cracks detected.	
TP 349-29	End Abutment – Backwall: There is a 2 square foot x up to 3 inches deep spalled area at the top of the end left backwall (Photo 17). In bay 3, there is a full height vertical hairline crack and a 3 square foot area of hollowness (Photo 18). See End Abutment Deterioration Sketch.	17,18
TP 349-31	End Abutment – Stem: The stem has been recently repaired, cleaned and a surface sealant applied. No hollow areas or significant cracks were detected. (Photo 13).	13
TP 349-33	End Abutment – Erosion: The paving block slope protection at the left side is deteriorated with settled and deteriorated blocks over a 30 square foot area (Photo 19).	19
	APPROACH ITEMS	
TP 349-53	Approach Drainage: At both approaches, the approach pavement at the curblines is slightly higher than the top of deck trapping runoff and causing shallow ponding along the shoulders at all four quadrants of the bridge (Photo 12 Typ).	12
TP 349-55	Approach Settlement: There is no significant settlement at the begin approach. At the end approach, there is +/- 0.5 inch of settlement in the travel lanes (Photo 11).	11
TP 349-57	Approach Pavement: At both approaches, the asphalt pavement adjacent to the bridge is transverse cracked and raveled with up to 4 inches wide x up to 2 inches deep potholes along the concrete headers. (Photos 1 & 11)	1,11
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth.	
TP 350-20	Deck - Curbs: The curbs are granite in good condition. The reveal is 8.5 inches.	

ITEM	REMARKS	PHOTO N0.
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – • The left safety walk has light map cracking throughout (Photo 20). No hollow sounding areas were detected.	20
	• The right safety walk has map cracking throughout. There are several small spalls less than one inch deep with crumbly concrete surrounding the spalls (Photo 21). No hollow sounding areas were detected. The begin right safety walk has been repaired (Photo 22). Fascias –	21,22
	• Left - The upper (safety walk) portion of the left fascia is tight mapcracked throughout (Photo 23). The remainder of the left fascia has tight map cracking of the surface over 10% of the surface, primarily beneath the railing posts (Photo 23). The begin left fascia is spalled 8 inches high x 8 inches wide x up to 4 inches deep with exposed reinforcing (Photo 24).	23,24
	• Right - The upper (safety walk) portion of the right fascia is mapcracked with light efflorescence throughout (Photo 25). There is horizontal hairline cracking with efflorescence just beneath the upper portion of the fascia over estimated 20% of the fascia. The remainder of the right fascia has tight map cracking of the surface over 10% of the surface, primarily beneath the railing posts (Photo 25). The end right fascia is cracked and spalled with exposed reinforcing at the lower right corner (Photo 26).	25,26
TP 350-22	Deck - Railings: The railings are in good condition with only minor rust speckling of the galvanized surface. There is chain link snow fence attached to the left and right railings above Kirkville Road. At both sides, the bottom horizontal pipe ends and the bottom attachments to the vertical posts are heavily rusted (Photo 27) with several ends detached (Photo 28). The fence fabric is in good condition and securely attached to the top and bottom horizontal pipes and the vertical posts.	27,28
	<u>SUPERSTRUCTURE ITEMS</u>	
TP 350-27	Structual Deck: Record plans indicate the initial structural deck is 8 inches thick concrete mono deck. SIP forms were not used. Records indicate the deck received a 1.75 inch concrete overlay in 1987.	
	Top of Deck - There is scattered random cracking throughout (Photo 29 Typ) with scattered hollow areas as illustrated in the Top of Deck Deterioration Sketch. There are 3 patches in the top surface of the deck in the right lane (Photo 30 Typ); and a 4 inches long x 12 inches wide X 1 inch deep spall located in the center lane near mid-span (Photo 31) Total hollow area is <1%.	29,30,31
	Underdeck – The underside of the deck is hairline map cracked throughout (Photo 32). There are scattered more pronounced cracks, some with efflorescence; delaminations, hollow areas, and damp areas; and spalls, some with exposed rusted reinforcing bars. The deteriorated areas are illustrated on the Underside of Deck Deterioration Sketch; and significant areas noted below:	32
	• Bay 1 near diaphragm 5 – 15 square foot area of hollow sounding concrete and spalling up to 1.5 inches deep with exposed rusted reinforcing (Photo 33).	33
	• Bay 1 at end – 15 square foot area of map cracking, dampness, hollowness with efflorescence and staining. (Photo 34).	34

ITEM	REMARKS	PHOTO N0.
TP 350-27	• Bay 5 in diaphragm bay 2 – 25 square foot area of map cracking and 1/16 inch cracks with dampness and efflorescence (Photo 35).	35
	• Bay 6 at begin – 12 square foot area of map cracking, 1/16 inch cracks, dampness, efflorescence and staining (Photo 36).	36
	• Bay 6 in diaphragm bay 1 – 20 square foot area of map cracking, 1/16 inch cracks, efflorescence and staining (Photo 37).	37
	• Bay 6 at end – 15 square foot area of map cracking, 1/16 inch cracks, dampness, efflorescence and staining in a previously patched area (Photo 38).	38
	• End Right – The haunch above the backwall at the end left is spalled (Photo 39)	39
TP 350-28	Primary Members: Good condition; surface rusting where the paint has peeled or blistered. No significant section loss.	
TP 350-29	Secondary Members: Good condition; surface rusting where the paint has peeled or blistered. No significant section loss.	
TP 350-30	Paint: The paint system is failed on less than 5% of the surfaces of the girders and diaphragms (Photo 40). There is cracking and peeling of the paint on the bottom flanges (Photos 41 & 42). There is surface rusting where the paint has peeled or blistered. The outside webs of the fascia girders near the bearings have scattered blistering and peeling paint.	40,41,42
	UTILITIES ITEMS	
TP 350-43	Lighting: None.	
TP 350-44	Sign Structure: None.	
TP 350-45	Utilities and Support: None visible.	

ITEM	REMARKS	PHOTO N0.
	SPECIAL EMPHASIS ITEMS Special Emphasis Inspection Required · Non-Redundant/Fracture Critical Members – No · Pin and Hangers – No · Fatigue-Prone Welds – No · Non-Categorized Fatigue-Prone Details – No · Other – No Special Emphasis Details · No Special emphasis details.

PROJECT LOCATION

THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481I-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481I-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

WORK TO BE DONE ON BIN 1093671:

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION.
2. REMOVE EXISTING BRIDGE JOINT AND ARMOR DECK ANGLE AT END ABUTMENT, (NORTH).
3. REMOVE ARMORING DECK ANGLE AT BEGINNING ABUTMENT, (SOUTH).
4. PLACE NEW BRIDGE JOINT AT END ABUTMENT, ("MAC" JOINT).
5. REPAIR DECK AREA AT BEGINNING ABUTMENT WHERE ARMORING ANGLE WAS REMOVED.
6. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES.
7. PERFORM MISCELLANEOUS REPAIRS TO CONCRETE ELEMENTS AT ABUTMENTS.

WORK TO BE DONE ON BIN 1093672:

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION.
2. REMOVE EXISTING BRIDGE JOINT AND ARMORING DECK ANGLE AT END ABUTMENT, (NORTH).
3. REMOVE ARMORING DECK ANGLE AT THE BEGINNING ABUTMENT, (SOUTH).
4. PLACE NEW BRIDGE JOINT AT END ABUTMENT, ("MAC" JOINT).
5. REPAIR DECK AREA AT BEGINNING ABUTMENT WHERE ARMORING ANGLE WAS REMOVED.
6. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES.
7. PERFORM MISCELLANEOUS REPAIRS TO CONCRETE ELEMENTS AT ABUTMENTS.

NOTE:

"MAC" JOINT IS A MODIFIED ARMORED JOINT SYSTEM WITH COMPRESSION SEAL.

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1-09367-1
Interstate Route 481 South Bound over Kirkville Road

Prepared for:

New York State
Department of Transportation

PIN 3804.00.101

LaBella Project No. 97132

May, 1998

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 South Bound Bridge over Kirkville Road. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-09367-1 Interstate Route 481 South Bound over Kirkville Road

Type of Material	Estimated Amount
Sheet Packing	10 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 South Bound Bridge over Kirkville Road (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09367-1 Interstate Route 481 South Bound over Kirkville Road

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 10 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093671 (I-481 SB/Kirkville Rd)

This memorandum summarizes the seismic screening conducted for BIN 1093671 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 1.0% of the top and 2.6% of the underside of the deck area. The cores indicate the reinforcement steel is 3.0 to 4.0 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at two of the sample locations are significantly higher than the corrosion threshold for steel, the third sample location was equal to the threshold value.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Damaged areas at the underside of the deck will require full depth reconstruction. Any corrosion of the reinforcement steel will be sandblasted or hydro-blasted. Reinforcement with significant section loss will be replaced. Partial and full depth removal areas will be reconstructed to adjacent grade. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove the portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The lower portion of the fascia or deck soffit is in better condition and only partial removal of damaged areas is necessary. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck partial reconstruction will be a nominal 6 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $565,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $649,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

INTRODUCTION

a. Bridge History
   i. Year Built: 1972
   ii. Bridge Type: Single Span, Steel Multi-girder
   iii. Span Length: 113 feet – 6 inches
   iv. Out-to-Out Width: 55 feet
   v. Structural Ratings and Rankings
      1. Federal Sufficiency: Update not available
      2. Condition Rating: Update not available
      3. General Recommendation: Update not available
   vi. Live Load Posting (HS25): No
   vii. National Highway System (NHS): Yes
   viii. Previous work Done:

1987 – Replace wearing surface (asphalt concrete overlay) with concrete overlay
1992 – Clean and paint metal surfaces
1998 – Asbestos testing
1999 – Waterproofing bridge deck and corrosion inhibitor
2006 – Repair structural bridge deck
2008 – Repair structural bridge deck
2012 – Structural deck replacement

   ix. Planned Future Work: N/A

b. Highway Classification

i. Functional Classification: Urban Principle Arterial - Interstate

ii. Traffic Volumes

YEAR	AADT
2014	25226
2034	37485
2054	55700

iii. Plan for Maintenance and Protection of Traffic:
Maintenance and protection of traffic will be achieved by staged construction.

ASSIST. TEAM LEADER: T. OLMSTEAD

ITEM	REMARKS	PHOTO NO.
	GENERAL NOTE The entire bridge deck was replaced in 2012 with new precast deck panels. There are no joints at either approach of the bridge and the deck is continuous with the new precast concrete approach panels at the begin and end approaches (Photo 1). There is a sleeper slab at the end of the end approach slab (Photo 2). The deck element curbs, safety walks, and railings and fascias were replaced with precast integral single slope parapets.	1,2
	BEGIN ABUTMENT ITEMS	
TP 349-22	Begin Abutment - Joint with Deck: There is a new jointless precast approach slab (Photo 3).	3
TP 349-24	Begin Abutment – Bearings: The begin bearings are fixed. All of the bearings have pack rust between the rocker and the masonry plate that restricts movement. The fascia bearings G1 and G7 are the worst (Photo 4). The bearing at G5 has a substantial deposit of guano increasing the corrosive environment at the bearing (Photo 5).	4,5
TP 349-26	Begin Abutment - Seat and Pedestals: The seat is cracked 4 feet long along the front right edge in bay 2 and in front of pedestal 3 (Photo 6). The crack wraps down the stem at this location. The seat is otherwise in generally good condition. The pedestals are in generally good condition with no significant cracks or any hollow areas detected. The left face of pedestals P1 has minor tight mapcracking and the bottom has surface scaling up to 0.5 inch deep, but no hollow sounding concrete (Photo 7).	6,7
TP 349-28	Begin Abutment – Backwall: There is a new jointless precast approach slab with an integral backwall haunch detail. The original backwall below the haunch is in generally good condition. There is a full height crack at the right side of bay 2 (Photo 8).	8
TP 349-30	Begin Abutment – Stem: The stem has been repaired with several patched areas as illustrated on the Begin Abutment Deterioration Sketch. Generally, the stem has tight mapcracking throughout. The top of the stem beneath the right side of bay 2 is cracked and there is a 3 square foot delaminated area with a 1 square foot spall (Photo 9). There is a horizontal crack with efflorescence and staining at the top right side beneath bay 6 (Photo 10). No other hollow areas or significant cracks were detected.	9,10
TP 349-32	Begin Abutment – Erosion: The paving block slope protection at the left side is deteriorated with settled and deteriorated blocks over a 20 square foot area (Photo 11).	11

ITEM	REMARKS	PHOTO NO.
	END ABUTMENT ITEMS	
TP 349-23	End Abutment - Joint with Deck: The end bearings are expansion. There is a jointless precast approach slab (Photo 12) with a sleeper slab at the end of the end approach slab.	12
TP 349-25	End Abutment – Bearings: The end bearings are expansion. All of the bearings are slightly extended at 20 ºF. The bearing at G7 is the worst with the end of the sole plate overhanging the back edge of the masonry plate by +/- 1/8 inch (Photo 13).	13
TP 349-27	End Abutment - Seats and Pedestals: The seat is generally in good condition with no hollow areas or significant cracks detected. The top on the right side of pedestal 7 has a one square foot area of surface spalling up to 1.25 inch deep (Photo 14).	14
TP 349-29	End Abutment – Backwall: There is a jointless precast approach slab with an integral backwall haunch detail (Photo 15). The bottom of the precast haunch is impinging on the top of the original backwall. The expansion and contraction movement of the deck and end approach slab above the original backwall is not adequately accommodated and portions of the old backwall are cracked, delaminated and spalled in bay 4 (Photos 16 & 17) and bay 6 (Photo 18) as illustrated on the End Abutment Deterioration Sketch. Additionally, there is 0.5 square foot of spalling and vertical cracking with 4 square feet of surface scaling at the end right (Photo 19).	15,16,17 18,19
TP 349-31	End Abutment – Stem: The stem has been repaired with several patched areas as illustrated on the End Abutment Deterioration Sketch. Generally, the stem has tight mapcracking throughout (Photo 20). Additionally, there are scattered vertical cracks and a 2 square foot hollow sounding area at the top near bay 6.	20
TP 349-33	End Abutment – Erosion: The paving block slope protection at the left side is deteriorated with settled and deteriorated blocks over 30 square foot area mostly toward the left side (Photo 21).	21
	APPROACH ITEMS	
TP 349-53	Approach Drainage: There are no drainage problems on the bridge.	
TP 349-55	Approach Settlement: There is no settlement at either approach.	
TP 349-57	Approach Pavement: There are new precast concrete approach slabs. There is a sleeper slab at the end of the end approach slab.	

ITEM	REMARKS	PHOTO NO.
	DECK ITEMS	
TP 350-19	Deck - Wearing Surface: The ride quality of the deck is smooth.	
TP 350-20	Deck - Curbs: There are no curbs on the bridge.	
TP 350-21	Deck - Sidewalks and Fascias: Sidewalks – There are no sidewalks or safety walks on the bridge. Fascias – Fascias – There are new precast concrete single slope parapets integral with the deck on either side of the bridge (Photos 1 & 22).	1,22
TP 350-22	Deck - Railings: There are no railings on the bridge.	
	SUPERSTRUCTURE ITEMS	
TP 350-27	Structual Deck: The structural deck is comprised of precast concrete deck panels (Photo 1).	1
	Fascia panels – There are 5 integral single slope parapet panels 22 feet - 4.25 inches long x 11 feet - 1 inch wide on either side. Interior panels – There are 10 interior panels 31 feet – 2 inch wide x 10 feet – 10.625 inches long. There are 10 inches wide closure pours evident between the fascia panels and the interior panels; and the remaining closure pours are 7 inches wide. There are scattered tight shrinkage cracks in the closure pours, mostly longitudinal along the lengths of the closures. (Photo 23).	23
	There are scattered diagonal, longitudinal and transverse cracks in the precast deck panels (Photos 3 & 24; and 16 & 25) that are illustrated in the Top of Deck Deterioration and Under Side of Deck Deterioration Sketches. Most of the deck panel cracks are sealed with epoxy crack sealant (Photo 26).	3,24 16,25 26
TP 350-28	Primary Members: Good condition; surface rusting where the paint has peeled or blistered (Photo 27). No significant section loss.	27
TP 350-29	Secondary Members: Good condition; surface rusting where the paint has peeled or blistered. No significant section loss.	
TP 350-30	Paint: The paint system is failed on less than 5% of the surfaces of the girders and diaphragms. There is cracking and peeling of the paint on the bottom flanges (Photos 27 & 28). The outside webs of the fascia girders G1 and G7 have scattered blistering and peeling paint (Photos 29). There is surface rusting where the paint has peeled or blistered.	27,28,29

ITEM	REMARKS	PHOTO NO.
	UTILITIES ITEMS

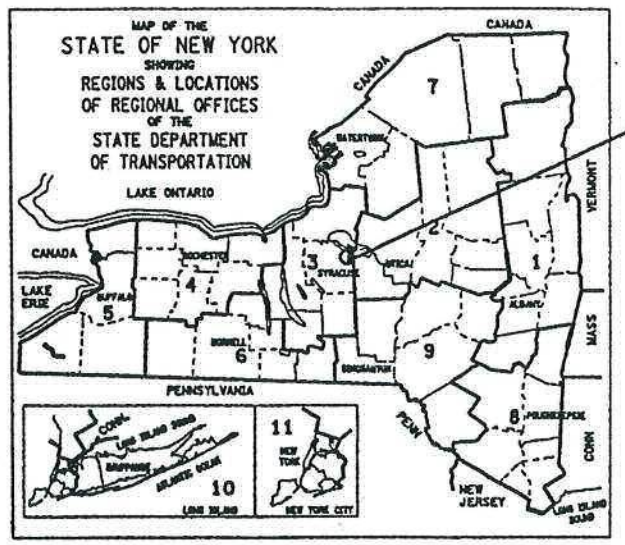
D259214



THIS IS A BRIDGE REHABILITATION PROJECT ON VARIOUS BRIDGES ON INTERSTATE 481, LOCATED IN THE TOWNS OF CICERO AND DEWITT IN ONONDAGA COUNTY. THIS WORK CONSISTS OF BRIDGE JOINTS, BEARINGS, BRIDGE RAIL AND CONCRETE REPAIR OF SUBSTRUCTURES. THERE ARE 28 BRIDGES IN THE PROJECT BEGINNING AT REFERENCE MARKER 481I-3301-1000 SOUTH OF THE CITY OF SYRACUSE AND ENDING AT REFERENCE MARKER 481I-3301-2143. I481 INTERCHANGE NORTH OF THE CITY.

SCALE: 1:24000

WORK TO BE DONE ON BIN 1093671:

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION.
2. REMOVE EXISTING BRIDGE JOINT AND ARMOR DECK ANGLE AT END ABUTMENT, (NORTH).
3. REMOVE ARMORING DECK ANGLE AT BEGINNING ABUTMENT, (SOUTH).
4. PLACE NEW BRIDGE JOINT AT END ABUTMENT, ("MAC" JOINT).
5. REPAIR DECK AREA AT BEGINNING ABUTMENT WHERE ARMORING ANGLE WAS REMOVED.
6. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES.
7. PERFORM MISCELLANEOUS REPAIRS TO CONCRETE ELEMENTS AT ABUTMENTS.

WORK TO BE DONE ON BIN 1093672:

1. ESTABLISH MP&T SCHEME FOR STAGE CONSTRUCTION.
2. REMOVE EXISTING BRIDGE JOINT AND ARMORING DECK ANGLE AT END ABUTMENT, (NORTH).
3. REMOVE ARMORING DECK ANGLE AT THE BEGINNING ABUTMENT, (SOUTH).
4. PLACE NEW BRIDGE JOINT AT END ABUTMENT, ("MAC" JOINT).
5. REPAIR DECK AREA AT BEGINNING ABUTMENT WHERE ARMORING ANGLE WAS REMOVED.
6. PERFORM MINOR REPAIRS TO ASPHALT APPROACHES.
7. PERFORM MISCELLANEOUS REPAIRS TO CONCRETE ELEMENTS AT ABUTMENTS.

NOTE:

"MAC" JOINT IS A MODIFIED ARMORED JOINT SYSTEM WITH COMPRESSION SEAL.

Bridge Deck Replacement Information

BIN:	1093672
Feature Carried:	I-481 NB
Feature Crossed:	Krikville Road
Original Contract Number:	FISH 70-7
Secondary Contract Number:	None

Geometry

Bridge Length from Bridge Begins to Bridge Ends (ft):	115.56
Existing Bridge Width (ft):	54
Existing Curb to Curb / Face of Rail to Face of Rail (ft):	51
Assumed Existing Total Deck Thickness (in):	9.75
Proposed Bridge Width (ft):	55.00
Proposed Curb to Curb / Face of Rail to Face of Rail (ft):	52
Number of Spans:	1
Length of Each Span, CL of Brgs to CL of Brgs (ft):	113.5
Skew Angle:	10.2125
Proposed Deck Thickness (in):	8.5
Begin Approach Slab Length (ft):	46.5
Begin Approach Slab Width (ft):	55
End Approach Slab Length (ft):	41.5
End Approach Slab Width (ft):	55

(The ends of both approach slabs are parallel to the centerline of bearings unless otherwise shown on a detail. The length of the approach slab is measured parallel to the station line. The width is measured perpendicular to the station line.)

Superstructure

Number of Girders in Transverse Section:	7
Girder Type:	Steel
Center to Center Girder Spacing (ft):	8
Left Overhang - center of girder to edge of deck (ft):	3.50
Right Overhang - center of girder to edge of deck (ft):	3.50
Width of Left Brush Curb or Sidewalk (ft) (Width of the curb is not included):	0.00
Width of Right Brush Curb or Sidewalk (ft) (Width of the curb is not included):	0.00
Type of Shear Connectors:	Studs
Number of Studs on Girder Flange Transversely by row:	3
Longitudinal Spacing of Rows of Studs (in):	6
Scuppers:	None

Staging

Staging Diagram:	Full Closure
"A" Dimension (ft)	Not Applicable
"B" Dimension (ft)	Not Applicable

Number of Girders in Stage 1 Transverse Section:	5
Number of Girders in Stage 2 Transverse Section:	Not Applicable

Superstructure Slab Reinforcement

Deck Reinforcement Design to be Provided:	Traditional
Type of Reinforcement to be Provided:	Epoxy Coated Steel
Top Transverse Bar Size:	#5
Top Transverse Bar Max. Spacing (in):	6
Bottom Transverse Bar Size:	#5
Bottom Transverse Bar Max. Spacing (in):	6
Top Longitudinal Bar Size:	#5
Top Longitudinal Bar Max. Spacing (in):	18
Bottom Longitudinal Bar Size:	#5
Bottom Longitudinal Bar Max. Spacing (in):	9
Additional Top Overhang Reinforcement:	#5 @ 6"
Additional Top Overhang Reinforcement Required for Stage 1 Overhang?	Not Applicable
Additional Top Overhang Reinforcement Required for Stage 2 Overhang?	Not Applicable
Additional Negative Moment Reinforcement:	Not Applicable
Locations of points of dead load contraflexure:	Not Applicable

(Additional negative moment reinforcement shall be required on all continuous spans. The additional reinforcement shall be placed in the top mat to a point 2'-6" beyond the points of dead load contraflexure on either side of the pier.

Approach Slab Reinforcement

Top Transverse Bar Size:	#5
Top Transverse Bar Max. Spacing (in):	8
Bottom Transverse Bar Size:	#5
Bottom Transverse Bar Max. Spacing (in):	8
Top Longitudinal Bar Size:	#5
Top Longitudinal Bar Max. Spacing (in):	8
Bottom Longitudinal Bar Size:	#5
Bottom Longitudinal Bar Max. Spacing (in):	8

(See BD Sheet SA1R1 and SA3E for corner reinforcement details with steel railings)

Begin Approach Sleeper Slab Detail:	No Sleeper Slab Required
End Approach Sleeper Slab Detail:	Sleeper Slab Detail (See Detail)

(If required, the Sleeper Slab Detail is provided in the proposal.)

Minimum Lap Lengths for Superstructure Slabs, Approach Slabs, and Barriers.

#4 bar - 1'-9"
#5 bar - 2'-2"
#6 bar - 2'-10"
#7 bar - 4'-9"

Railing/Barrier

Bridge Railing/ Barrier Type (Left): Concrete Single Slope

Bridge Railing/Barrier Type (Right): Concrete Single Slope

Pedestrian Fence Required? No

(When required Pedestrian Fence shall be used for the whole length of the bridge.)

Snow Fence Required? No

(When Snow Fence is required it shall only be used at locations to protect the under roadway.)

Joint Details

Required Joint Detail at Begin Abutment: Backwall Detail for Precast (See Fixed Detail)

Total Movement at Begin Abutment or Begin Sleeper Slab (in): Not Applicable

Required Joint Detail at Pier(s): Not Applicable

Total Movement at Pier (in): Not Applicable

Required Joint Detail at End Abutment: Backwall Detail for Precast (See Fixed Detail)

Total Movement at End Abutment or End Approach Slab (in): 1.47

(If an armorless joint is required, then the contractor shall choose a joint opening using the table on BD-JT1E. The seal type shall be determined by the contractor and the total movement is provided.)

PRECAST CONCRETE DETAILS

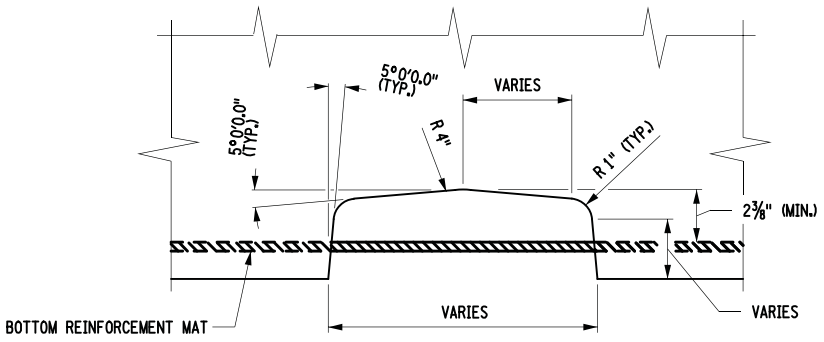
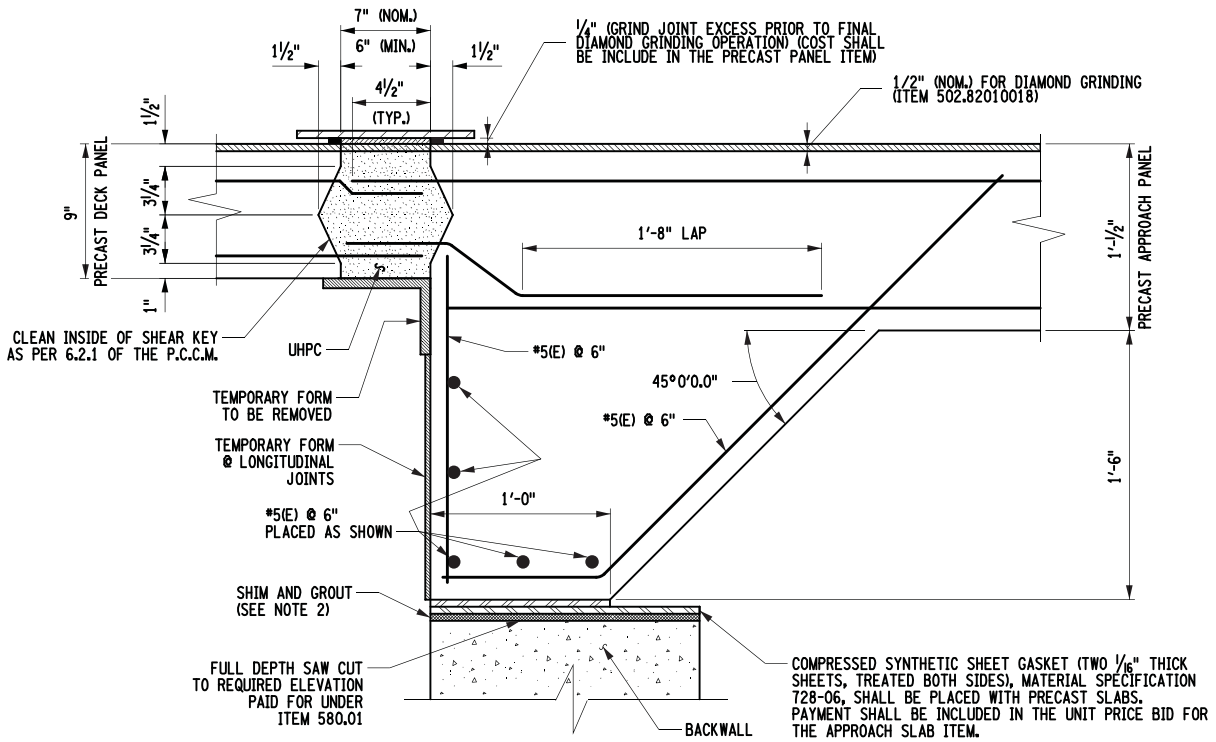
DETAIL "B"
ELASTOMERIC CONCRETE HEADER

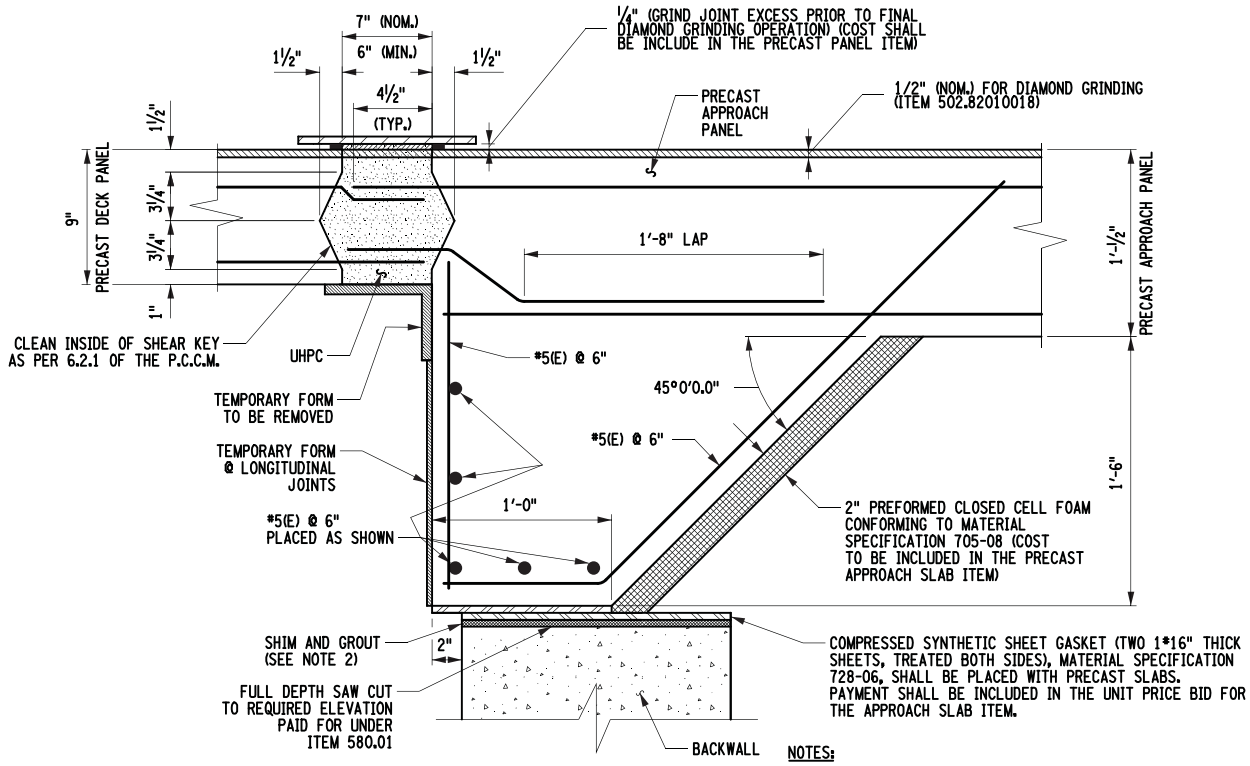


SHEAR CONNECTOR POCKET DETAIL

BACKWALL DETAIL FOR PRECAST



UHPC BACKWALL FIXED JOINT DETAIL



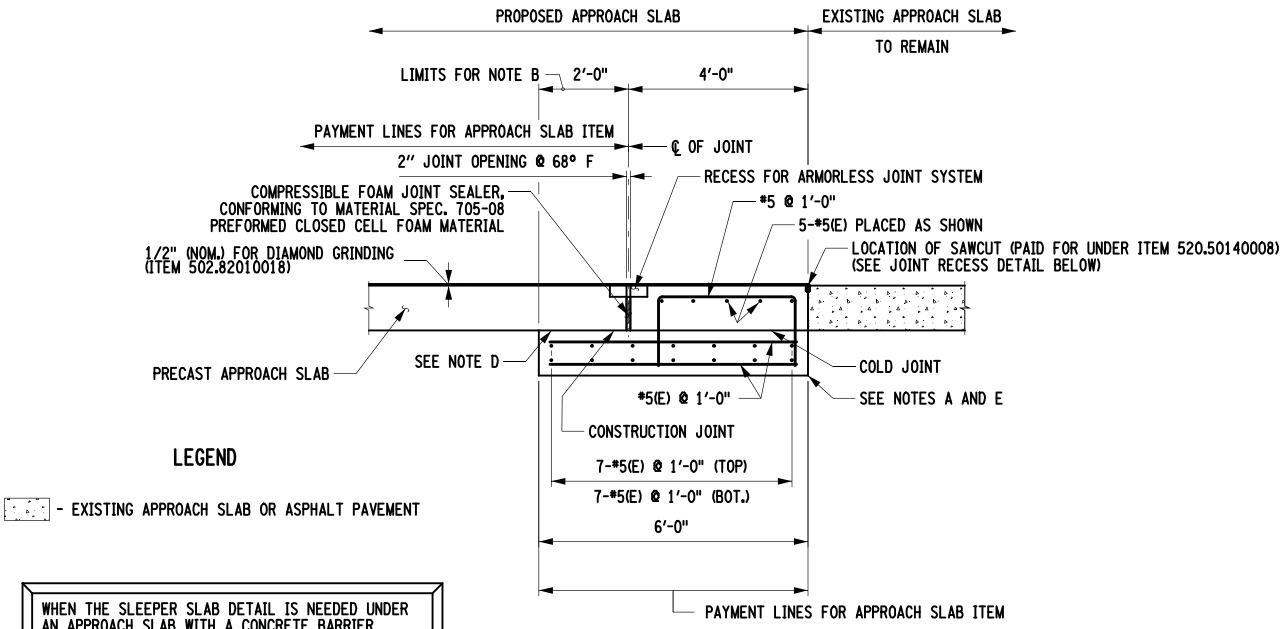
UHPC BACKWALL EXPANSION JOINT DETAIL

NOTES:

1. FINAL COVER FOR STEEL REINFORCEMENT IN PRECAST PANELS SHALL BE 2" (MIN.) FOR TOP MAT AND 1½" FOR BOTTOM MAT.

2. CONCRETE GROUTING MATERIAL SHALL CONFORM TO MATERIAL SPECIFICATION SECTION 701-06. COST SHALL BE INCLUDED IN PRICE BID FOR THE DECK PANEL ITEM.

PRECAST CONCRETE DETAILS



WHEN THE SLEEPER SLAB DETAIL IS NEEDED UNDER AN APPROACH SLAB WITH A CONCRETE BARRIER ATTACHED TO IT, THE SLEEPER SLAB SHALL BE FROM FACE OF BARRIER TO FACE OF BARRIER.

PRECAST SLEEPER SLAB DETAIL

NOTES:

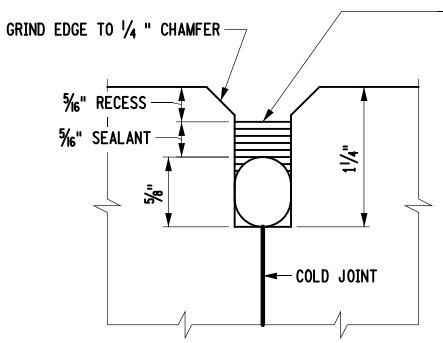
A. EXCAVATION FOR SLEEPER SLABS SHALL BE CAREFULLY MADE AFTER COMPACTED ABUTMENT EMBANKMENT IS IN PLACE. THE SLEEPER SLABS SHALL BE FOUNDED ON UNDISTURBED COMPACT MATERIAL OR RE-COMPACTED MATERIAL. NO LOOSE BACKFILL SHALL BE ALLOWED. THE CONTRACTOR SHALL TAKE ALL NECESSARY PRECAUTIONS TO PROTECT THE SLEEPER SLAB FROM TEMPORARY LOADINGS OR ANY CONDITION WHICH COULD CAUSE MOVEMENTS OR UNEVEN SETTLEMENT OF THE SLEEPER SLAB.

B. TOP OF SLEEPER SLABS SHALL BE STEEL TROWEL FINISHED AND COATED WITH A 0.04 in. NOMINAL THICKNESS OF PERFORMANCE GRADE ASPHALT AS INDICATED IN THE PROPOSAL, OR MATERIAL SPECIFICATION 702-3101. THE TOP OF SLEEPER SLABS SHALL FOLLOW THE CROSS SLOPE AND GRADE OF ROADWAY. COST TO BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB ITEM.

C. PAYMENT FOR THE ELASTOMERIC CONCRETE HEADERS SHALL BE INCLUDED IN THE ITEM FOR THE JOINT SYSTEM. THE JOINT SYSTEM SHALL BE PAID FOR UNDER ITS APPROPRIATE ITEM.

D. COMPRESSED SYNTHETIC SHEET GASKET, MATERIAL SPECIFICATION 728-06 (TWO 1/16" THICK SHEETS. TREATED BOTH SIDES) SHALL BE PLACED WITH PRECAST UNITS. SHIM AND GROUT AS CALLED FOR ON THE BACKWALL DETAILS. PRICE WILL BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB ITEM.

E. PAYMENT FOR SLEEPER SLAB EXCAVATION SHALL BE INCLUDED IN THE APPROACH SLAB ITEM.



FILL THE RECESS WITH A STRUCTURAL JOINT MATERIAL, SILICONE SEALANT, FROM THE DEPARTMENT'S APPROVED LIST FOR ITEM 567.51--16. IF THE RECESS IS SAW CUT, WATER BLAST IMMEDIATELY FOLLOWING CUTTING TO REMOVE ANY RESIDUAL SLURRY BEFORE IT DRIES. CLEAN THE VERTICAL FACES OF THE RECESS BY ABRASIVE BLAST AND AIR BLOW THE RESIDUE FROM THE RECESS. PRIME THE VERTICAL FACES WITH THE MANUFACTURER'S RECOMMENDED PRIMER, AND ALLOW TO DRY. PLACE A 5/8" DIA. SOFT CLOSED CELL BACKER ROD IN THE BOTTOM OF RECESS. POUR THE SILICONE SEALANT TO A DEPTH OF APPROX. 5/16". PAYMENT TO BE INCLUDED IN THE UNIT PRICE BID FOR THE APPROACH SLAB.

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 North Bound Bridge over Kirkville Road. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-09367-2 Interstate Route 481 North Bound over Kirkville Road

Type of Material	Estimated Amount
Sheet Packing	10 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 North Bound Bridge over Kirkville Road (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints which might affect the removal of the ACM were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by EMSL Analytical, Inc. or New York Testing Laboratories, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09367-2 Interstate Route 481 North Bound over Kirkville Road

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 10 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Beg Abut -- Abutment: Seats and Pedestals -- Rated 4, Was 4
End Abut -- Abutment: Bearings, Bolts, Pads -- Rated 3, Was 5
End Abut -- Abutment: Seats and Pedestals -- Rated 4, Was 4
Referenced Photos: "2"
2012 - The begin, end bearings, and seat are covered with pigeon debris and the end bearings are filled with pack rust and previous paint. They are frozen and therefore a 3.

Note ID: 351210936720000

Approaches: Settlement -- Rated 4, Was 6
Approaches: Pavement -- Rated 4, Was 5
End Abut -- Abutment: Joint with Deck -- Rated 3, Was 5
Referenced Photos: "1"
2012 - The end joint elastomer header is spalling on the end side of the right side of the center line approx. 4' long by 4" deep. The rubber joint appears pulling away from the steel headers mainly on the right side. The begin and end asphalts have mapcracking.

Note ID: 351210936720003

Approaches: Guide Railing -- Rated 4, Was 6
Referenced Photos: "4"
2012 - The begin left quad guiderail has been impacted, bending over 3 consecutive posts.

Note ID: 351210936720005

Span 001 -- Deck Elements: Wearing Surface -- Rated 4, Was 4
Span 001 -- Deck Elements: Mono Deck Surface -- Rated 4, Was 4
Referenced Photos: "5", "6"
2012 - At the begin the monodeck is cracked/patched directly above the efflo/saturated/mapcracked structural deck. Cracking is extensive in the right begin and shoulder area. It appears to be recently patched in the cracks. At the end there are large patches in the deck at the end right in areas 6' by 6' and 8' by 3'. These areas cover approx. 25% of deck surface and create a rough ride. The edges of the asphalt patches are spalling away allowing for more deck saturation as seen on deck sketch. It is suggested that this bridge gets a new deck.

Note ID: 351210936720004

Span 001 -- Deck Elements: Sidewalks, Fascias -- Rated 4, Was 4
Referenced Photos: "7"
2012 - The right fascia has 3 spalls to the bottom corner approx. 10' long. At this time none seen that would fall on traffic below. The spalls are over lanes 2 and 3 out of 6 lanes counting from the begin abutment.

Inspection Date: 10/10/2012 RC: 33 BIN: 1093672

Inspection Notes

Carried: 481I 481I33012078 Crossed: KIRKVILLE RD-CR53 CheckValue: 1,799,362,570

Note ID: 351210936720006

Span 001 -- Superstructure: Structural Deck -- Rated 3, Was 3
Referenced Photos: "8", "9", "11", "12", "13", "14", "15", "16"
2012 - The end right has a 3.5' by 2" spall to rebar and another area that was recently repaired with the plywood forms still in place in bay 6. At approx. the begin and end 1/3 of the span there is heavy efflo/mapcracking/dampness to the underside of deck (that has rained in days). Approx. 1/3 of the entire deck has this condition, and maching the top WS with the bottom saturation it is just a matter of time till it goes. See deck sketch. Also suggest further investingation for the deck.

Note ID: 351210936720007

Span 001 -- Superstructure: Paint -- Rated 4, Was 4
Referenced Photos: "10"
2012 - The paint system is failing on the bottom flanges mainly and the top of the fascia outside flanges. It starting to spread to the webs.

Note ID: 351210936720002

End Abut -- Abutment: Backwall -- Rated 4, Was 5
Referenced Photos: "3"
2012 - The end left backwall behind G1 is spalling at the top approx. 2' wide and up to 10" deep.

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 19, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093672 (I-481 NB/Kirkville Rd)

This memorandum summarizes the seismic screening conducted for BIN 1093672 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

No seismic retrofits are required for the bridge superstructure to substructure connection.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The begin joint is expansion. The seal is in fair condition. The begin header has hairline cracking spaced at +/-2' in the right shoulder, right lane, and right half of the center lane (Photo 1). The remainder of the header is in good condition. No leakage was noted from below.	1
TP 349-23	End Abutment - Joint with Deck: The end joint is expansion. The steel armor plates are rusted with no significant section loss, and there is a gap noted between the compression seal and the header for the right 2/3 of its length (Photo 2). The header is in good condition. Some leakage was noted from below (Photos 3 and 4).	2-4
TP 349-27	End Abutment – Seats and Pedestals: There is a 2 sf cracked and hollow area on the end seat in Bay 3 adjacent to the stem (Photo 4). There is a similar condition in Bay 2. The pedestals are in good condition. See End Abutment Deterioration Sketch.	4
TP 349-28	Begin Abutment – Backwall: There is a full height ¼" wide crack at the left corner with a 1' dia. spall at the top (Photo 5). The concrete is hollow sounding for a full height x 10" wide area. There is a 1/16" wide x 15" long vertical crack at the top in Bay 1 with a few shorter cracks stemming from it (Photo 6). No hollowness was found in this location.	5,6
TP 349-29	End Abutment – Backwall: There is a 6" long x 1/16" wide horizontal crack at the top left in Bay 5 with no hollowness (Photo 7). There is a 2' long diagonal crack at the right with 2 sf of hollowness (Photo 8). The remainder of the backwall is in good condition with scattered hairline cracking and staining.	7,8
TP 349-30	Begin Abutment – Stem: There is a 4 sf hollow area under Bay 3 (Photo 9) and a 3' high x 6" wide cracked area at the left (Photo 10). The remainder of the stem is in good condition with isolated hairline cracking.	9,10
TP 349-31	End Abutment – Stem: The end stem has 5 hollow areas and several cracks as shown in the End Abutment Deterioration Sketch (Photos 4 and 11).	4,11

ITEM	REMARKS	PHOTO N0.
TP 350-21	Spans 1 and 2 - Deck Elements - Sidewalks and Fascias: Sidewalks: Snow was removed from the safety walks at both ends of the spans as well as a few locations along the span for inspection. The left concrete safety walk appears in good condition. The right concrete safety walk has map cracking throughout (Photo 12).	12
	Fascias: The fascias have scattered map cracking (Photo 13). The left fascia has a 1/16" wide x 2' long crack under the 4th snow fence post in Span 1 (Photo 14). The right fascia has a 1' long x 5" x 3" deep spall at the end of Span 1 with hollowness surrounding it (Photo 15).	13-15
TP 350-22	Spans 1 and 2 - Deck Elements – Railings/Parapets: The right box beam bridge railing in Span 2 at the end of the snow fence has a loose bolt in the bottom rail but is solid (Photo 16). The remainder of the right and the entire left bridge railing are in good condition. Snow fencing is present over the I-90 travel lanes and median on both sides of the bridge. The snow fence consists of 11 steel pipe posts in each span located at rail posts, steel pipe rails, and chain link fencing. On the left in Span 1 the bottom pipe rails at Posts 7, 8, and 9 are rusted through and detached on one or both sides (Photo 17). On the left in Span 2 the bottom pipe rail at Post 4 is rusted through and detached on the end side. On the right in Span 2 the bottom pipe rails at Posts 1 and 6 are rusted through and detached on both sides. The bottom rails at several other posts throughout both spans are rusted but intact. The remainder of the snow fencing is in good condition.	16,17
TP 350-27	Spans 1 and 2 - Superstructure – Structural Deck: The structural deck is a 9.5" thick concrete mono deck with SIP forms. No hollow areas, cracked areas, or patches were found (Photo 18). The original 8" deck was rehabed in 2004 down to the top rebar mat. The deck has SIP forms, and the underside is exposed only at the overhangs and at the haunches adjacent to the abutment backwalls. The deck has spalling with exposed rebar at the begin left corner of Span 1 and the end left corner of Span 2. The spall at the begin left is 3' long x 3" wide x 5" deep (Photo 19). The spall at the end left is 2' long x 1' wide triangular and 5" deep (Photo 20). Both spalls have exposed rebar. The remainder of the overhangs have map cracking and transverse hairline cracking throughout (Photo 21). The haunch at the end abutment has a 1.5' long x 6" high x 3" deep spall in Bay 5 (Photo 7). The remainder of the haunch area has only hairline cracking.	7, 18-23

ITEM	REMARKS	PHOTO N0.
TP 350-27 (cont.)	The SIP forms in both spans have surface rust, mostly in the first three bays, but are in good condition (Photos 22, 23).	7, 18-23
TP 350-28	Spans 1 and 2 - Superstructure – Primary Members: The steel girders are in good condition with no significant section loss (Photos 22 and 23)	22,23
TP 350-30	Spans 1 and 2 - Superstructure – Paint: The girders and diaphragms have been painted since the 2012 Biennial Inspection, and the paint is in good condition (Photos 22-25).	22-25
TP 350-33	Pier – Bearings: The fixed bearings on the pier have been painted since the 2012 Biennial Inspection (Photo 24). The begin right bolt is sheared off on Bearing 4 (Photo 25). The remainder of the bearings are in good condition.	24,25
TP 350-34	Pier – Pedestals: Pedestal 6 has up to 1/16” wide cracking on its vertical faces but no hollow sounding surfaces (Photo 24). The remaining pedestals are in good condition.	24
TP 350-37	Pier – Cap Beam: The cap beam is cracked and hollow on the end face at the top in Bays 2 and 5. The area in Bay 2 is 2.5’ long x 13” high with a 3/16” wide crack and extends into the seat 6” (Photo 26). The area in Bay 5 is 3.5’ long x 1’ high and extends into the seat 11” (Photo 27). There is 1/16” wide cracking and light spalling.	26,27

NOTES:

The Contractor's attention is directed to the possibility of the soil described as silty fine sand and silt; fine gravelly being easily disturbed by construction traffic and precipitation upon exposure. Provision is, therefore, made for an undercut to construct a working platform of compacted Item No. 203.21 at the proposed pier should this become necessary. The Regional Soils Engineer shall be notified to be present during the final foot of excavation to the proposed pier footing elevation. The Regional Soils Engineer shall inspect the exposed soil at the proposed pier footing elevation and determine the need for and extent of a one(1') foot under cut to construct a working platform of compacted Item No. 203.21. The undercut recommended by the Regional Soils Engineer shall not exceed one(1') foot without the prior approval of the Deputy Chief Engineer (Structures).

For design purposes the foundation pressure at the extension does not exceed 2½ Tons per Square foot.

ASBESTOS SAMPLING SURVEY

Asbestos Sampling Survey

Location:

BIN 1-09368-1
Interstate Route 481 South Bound over I-90

Prepared for:

New York State
Department of Transportation

PIN 3804.06.121

LaBella Project No. 97132

October 1999

Table of Contents

Page

I. Project Summary 1

II. Site Description 1

III. Inspection Procedures 1

IV. Results 2

Certification 2

Figures and Table

I. Project Summary

In accordance with conditions of Term Agreement D010010, LaBella Associates, P.C. conducted an asbestos sampling survey of the Interstate Route 481 South Bound bridge over I-90. Based on laboratory analyses of bulk samples collected, the following material was determined to contain asbestos:

BIN 1-09368-1 Interstate Route 481 South Bound over I-90

Type of Material	Estimated Amount
Sheet Packing	9.3 Square Meters

II. Site Description

The Site is located in Onondaga County, New York. For the purpose of this report, the Site consists of the Interstate Route 481 southbound bridge over I-90 (See attached FIGURE 1 - Site Location Map).

III. Inspection Procedures

The following procedures were used to obtain the data for this Report:

A. A review of record drawings supplied by Region 3 personnel and a visual inspection of the subject structure were conducted to identify potential visible/accessible sources of asbestos-containing materials. Observations and notes were made to provide a description of the structure, and an estimate of the approximate amount, length, or area of ACM present.

B. Physical or operational constraints, which might affect the removal of the ACM, were identified and reported.

C. Bulk samples of suspected ACM were collected during the site inspection of the subject structure. Samples were taken from each homogeneous area that may contain ACM.

D. Samples were submitted for analysis. Preliminary PLM analyses of NOB materials were performed by LaBella Laboratories, a NYSDOH approved laboratory, to determine the presence and percentage of asbestos in each sample. TEM analyses of NOB materials, if necessary, were performed by Environmental Monitoring Systems, Inc.

E. Lab results were used to determine the approximate location, type, and amount of the verified ACM.

F. A drawing of the structure at the Site was created, in order to show sample locations and the approximate locations and amounts of confirmed ACM observed in accessible locations.

Only accessible areas were inspected. Inaccessible areas, such as areas within the bridge or the approaches to the bridge were not included in this inspection. No investigation was conducted by LaBella Associates to determine the presence of underground utilities on or in the immediate vicinity of the Site. Actual sample locations are shown in the attached FIGURE 2. Results of bulk sample analyses are tabulated in the attached TABLE.

IV. Results

BIN 1-09368-1 Interstate Route 481 South Bound over I-90

Sheet Packing

Asbestos-containing sheet packing is located between the tops of the abutments and the deck slab at both ends of the bridge. Most of this material is presently covered by the bridge deck, although the edges of this sheet packing are exposed and visible at various locations.

It is estimated that the total amount of this asbestos-containing sheet packing material on the bridge is approximately 9.3 square meters. This estimate is based on field measurements taken at the time of the site visit.

The approximate locations of this asbestos-containing sheet packing are shown in FIGURE 2.

Certification

LaBella Associates, P.C. certifies the accuracy of this report, to the best of our knowledge, based on the information collected as described in the Inspection Procedures Section of this investigation.

Beg Abut -- Abutment: Backwall -- Rated 4, Was 4
Beg Abut -- Wingwalls: Walls -- Rated 4, Was 4
End Abut -- Abutment: Backwall -- Rated 4, Was 4
End Abut -- Wingwalls: Walls -- Rated 4, Was 4
Referenced Photos: "3", "1", "8", "6"
2012 - At both stems the top corners of the backwall and adjacent portion of the wingwalls are cracked to mid height of backwall.

Note ID: 321210936810002

Approaches: Pavement -- Rated 5, Was 5
Referenced Photos: "5"
2012: Minor cracking along bridge joints allows for '5' rating at this time.

Note ID: 321210936810003

Span 001 -- Deck Elements: Curbs -- Rated 6, Was 4
Span 002 -- Deck Elements: Curbs -- Rated 6, Was 4
Referenced Photos: "4"
2012: Minor debris allows '6' rating of curbs.

Note ID: 321210936810004

Span 001 -- Superstructure: Paint -- Rated 2, Was 2
Span 002 -- Superstructure: Paint -- Rated 2, Was 2
Referenced Photos: "2"
2012 - The paint system has extensively failed along lower flanges and has failed along the lower 3/4's of the webs, with the remaining paint appearing chalky. Paint system has 40% to 50% loss. The steel primary members are now starting to have rust flakes with section loss approx. less than 5%. This being downrated to a 2 for both spans. Strongly recommend that this structure be painted.

Note ID: 321210936810005

Span 001 -- Pier: Bearings, Bolts, Pads -- Rated 4, Was 5
Referenced Photos: "11"
2012 - The fixed bearings at the pier were not replaced with the begin and end bearing project. They are severely corroded at this time. A single bolt is sheared; bearing #4, span #1, right side.

Note ID: 321210936810006

Span 001 -- Pier: Pedestals -- Rated 5, Was 5
Referenced Photos: "9"
2012: Minor cracking in right fascia pedestal.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 26, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093681 (I-481 SB/I-90)

This memorandum summarizes the seismic screening conducted for BIN 1093681 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Seat width improvements are required at pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

For the lower level earthquake ground motion, it is recommended that capacity/demand ratios for bridge components are calculated as per Section 5.4 of the referenced manual. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0% of the total deck surface area. The cores indicate the reinforcement steel is 4.25 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $730,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $1,035,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.

STRUCTURE IDENTIFICATION

a. Bridge Identification Number (BIN): 1093682
b. Reference Marker: 481I 3301 2088
c. Region: NYSDOT Region 3
d. County: Onondaga
e. Town: Dewitt
f. Feature Carried: I481 Northbound
g. Feature Crossed: I90

INTRODUCTION

a. Bridge History
   i. Year Built: 1972
   ii. Bridge Type: Two Span, Steel Multi-girder
   iii. Span 1 Length: 100 feet
   iv. Span 2 Length: 100 feet
   v. Out-to-Out Width: 44 feet
   vi. Structural Ratings and Rankings
      1. Federal Sufficiency: 84.9 (October 2012)
      2. Condition Rating: 4.625 (October 2012)
      3. General Recommendation: 5
   vii. Live Load Posting (HS25): No
   viii. National Highway System (NHS): Yes
   ix. Previous work Done: Overlay, new joints, new bearings & concrete repairs (2004). Superstructure painted (2013).
   x. Planned Future Work: N/A
b. Highway Classification
   i. Functional Classification: Urban Principle Arterial - Interstate
   ii. Traffic Volumes

YEAR	AADT Projected
2014	21658
2034	32183
2054	47823

   iii. Plan for Maintenance and Protection of Traffic: Maintenance and Protection of traffic will be achieved by staged construction.

A. TEAM LEADER: M. SAVINO

ITEM	REMARKS	PHOTO N0.
TP 349-22	Begin Abutment - Joint with Deck: The begin joint is expansion. The visible portion of the compression seal is detached from the header and partially torn for a 1.5' length 3' from the left of the right lane (Photo 1). Remaining seal is in good condition. The begin header has hairline cracking spaced at +/-15" in the right shoulder starting 1' to the left of the shoulder (Photo 2). The remainder of the header is in good condition. No signs of significant leakage were noted below.	1,2
TP 349-23	End Abutment - Joint with Deck: The end joint is expansion. The seal is in good condition. The end header has hairline cracking spaced at +/-15" in the right shoulder starting 1' to the left of the shoulder similar to the begin joint (Photo 3). Remainder of header is in good condition. No signs of significant leakage were noted below.	3
TP 349-27	End Abutment – Seats and Pedestals: There is a 6 sf hollow area in Bay 3 (Photo 4). Cracking was noted on the seats and top of the stem as shown in the End Abutment Deterioration Sketch. The pedestals are in good condition.	4
TP 349-28	Begin Abutment – Backwall: There is a 3’ high x 1.5’ wide x 1’ deep max. area at the top left that is spalled and hollow (Photo 5). There is also a 3/16" wide diagonal crack at the top right with 1/2" deep x 4" wide spalling along it and a 0.5 sf hollow area to its right (Photo 6). The remainder of the backwall is in good condition.	5,6
TP 349-29	End Abutment – Backwall: There is a 2.5’ dia. x 7” deep spall with exposed rebar at the top right corner (Photo 7). At the left there is a 3’ high x 2.5’ wide spall that is 10” deep max. at the top with exposed rebar (Photo 8). The remainder of the backwall is in good condition.	7,8
TP 349-30	Begin Abutment – Stem: The begin stem is in good condition with some hairline cracking mostly in Bay 4 (Photo 9). No hollow sounding areas were found (Photo 10).	9,10
TP 349-31	End Abutment – Stem: The end stem has several cracked and hollow areas with isolated spalling (Photo 11). There is a spall in Bay 3 measuring 7” wide x 3.5’ long x 1.13” deep with an adjacent 8 sf hollow area (Photo 12). See End Abutment Deterioration Sketch.	11,12

ITEM	REMARKS	PHOTO N0.
TP 350-21	Spans 1 and 2 - Deck Elements - Sidewalks and Fascias: Sidewalks: Snow was removed from the safety walks at both ends of the spans as well as a few locations along the span for inspection. Both sidewalks were in good condition where exposed. Fascias: Both fascias in Span 1 have hairline cracking throughout (Photo 13). The Span 2 left fascia has an 8" dia. x 1.5" deep spall at the begin with no exposed rebar (Photo 14). There is also a 1' long x 2" wide x 1" deep spall at the bottom chamfer between snow fence posts 6 and 7 with a 0.5 sf hollow area adjacent to it (Photo 15), and a 0.5 sf hollow and cracked area at the bottom chamfer between snow fence posts 7 and 8 (Photo 16). The Span 2 right fascia has a 1' x 8" x 1.5" deep triangular spall located 8' from the end (Photo 17). The remainder of the Span 2 fascias have hairline cracking throughout.	13-17
TP 350-22	Spans 1 and 2 - Deck Elements – Railings/Parapets: The bridge railing is in good condition. Snow fencing is present over the I-90 travel lanes and median on both sides of the bridge. The snow fence consists of 12 steel pipe posts in each span located at rail posts, steel pipe rails, and chain link fencing. Some of the bottom pipe rails are rusted at their connection to the posts. On the right in Span 1 the bottom pipe rail at Post 8 is rusted through and detached at the begin. On the right in Span 2 the bottom pipe rails at Posts 2 and 4 are rusted through and detached at the begin (Photo 18). The bottom rails at several other posts throughout both spans are rusted but intact. The remainder of the snow fencing is in good condition.	18
TP 350-27	Spans 1 and 2 - Superstructure – Structural Deck: The structural deck is a 9.5" thick concrete mono deck with SIP forms. No hollow areas, cracked areas, or patches were found (Photo 19). The original 8" deck was rehabed in 2004 down to the top rebar mat. The deck has SIP forms, and the underside is exposed only at the overhangs and at the haunches adjacent to the abutment backwalls. The overhangs have map cracking and transverse hairline cracking throughout (Photo 20). The haunch at the begin abutment has a 3' long x 10" high spall at the left (Photo 5). The remainder of the begin haunch area has only hairline cracking. The haunch at the end abutment has a 4' long x 6" high x 5" deep spall in Bay 1 (Photo 21). There is a loose portion of haunch that extends from Girder 2 to Girder 3 (Photo 22). The remainder of the end haunch area has only hairline cracking. The SIP forms in both spans have surface rust but are in good condition (Photo 23). A 2.5' long x full width section of SIP form is missing in Bay 1 near the end (Photo 24).	5,19-24

ITEM	REMARKS	PHOTO N0.
TP 350-21	Spans 1 and 2 - Superstructure – Primary Members: The steel girders are in good condition with no significant section loss (Photo 23 and 25).	23,25
TP 350-30	Spans 1 and 2 - Superstructure – Paint: The girders and diaphragms have been painted since the 2012 Biennial Inspection, and the paint is in good condition (Photos 23 and 25).	23,25
TP 350-31	Spans 1 and 2 - Superstructure – Joints: The Span 1 joint is fixed. The visible portion of the compression seal is detached from the header and partially torn for a 1.5' length located 3' from the left edge of the right lane (Photo 26). The remaining seal is in good condition. No significant leakage was noted from underneath.	26
TP 350-33	Pier – Bearings: The fixed bearings on the pier have been painted since the 2012 Biennial Inspection. Bolts are loose, sheared, or missing at Bearing 2 end right (Photo 27), Bearing 3 end left (Photo 28), and Bearing 5 begin left (Photo 29). The remaining bearings are in good condition.	27-29
TP 350-34	Pier – Pedestals: There is a 0.5 sf hollow area on the begin right corner of Pedestal 4 adjacent to a hollow area on the cap beam (Photo 30). Pedestal 5 is cracked on its begin and right faces with an 8” square hollow area at the begin right corner (Photo 31). The remaining pedestals are in good condition.	30,31
TP 350-37	Pier – Cap Beam: The begin face of the cap beam at the top has two hollow areas measuring 1.5’ wide x 10” high under Pedestal 4 (Photo 30) and 16” wide x 1’ high in Bay 4 (Photo 32). The end face has a 16” long 1/32” wide crack in Bay 1 located 4” below the seat (Photo 33) and a 1.5’ long x 10” high hollow area at the top under Pedestal 4 (Photo 34). The remainder of the cap beam has scattered hairline cracks.	30 32-34
TP 350-38	Pier – Columns: The front face of the right column has a 2.5’ wide x 1’ high spall at the bottom and a 1’ wide x 2’ high spall located 3’ from the bottom (Photo 35). Both spalls have exposed rebar and hollowness surrounding them. The hollowness extends to the right face for a 4” wide x 6’ high area. The remainder of the right column and the entire left column is in good condition.	35

CONCRETE OVERLAY NOTES

The finished overlay profiles for these structures are based on the existing top reinforcing bar cover (shown elsewhere in the plans) using the following criteria:

1. The minimum total cover (cover remaining over the reinforcing bars after the concrete removal (if any) plus the thickness of the new overlay material) shall be 2¾ inches.
2. The minimum thickness of the High Density Concrete Overlay shall be 2 inches.

If the Contractor has elected to bid on Item 15555.3001 Latex Modified Concrete Overlay, then the Contractor may submit a proposed finished profile to the Regional Director for approval. The proposed finished profile shall be submitted to the Regional Director at least two weeks before placement of the overlay and shall be based on the following criteria:

1. The minimum total cover (cover remaining over the reinforcing bars after the removal plus the thickness of the new overlay material) shall be 2¾".
2. The minimum thickness of the Latex Modified Concrete Overlay shall be 1¾ inches.
3. The transition lengths between the existing profile and proposed finished profile shall be of the same lengths as shown on the plans.
4. The Contractor's proposal may include additional grade transitions subject to the following:
   a. The minimum length between grade transitions shall be 60 feet.
   b. The slope of the grade transition shall not differ from the slope of the adjacent sections by more than .005% at the completion of the work.
   c. The slope changes do not create drainage problems on the bridge deck.

No overlay material shall be placed until the Regional Director has approved a satisfactory proposed finished profile.

* For location of Sections A-A & B-B See Drawing No. 13.

Inspection Notes

Carried: 481I 481I33012088 Crossed: 90I X CheckValue: 1,810,645,070

Note ID: 321210936820000

Beg Abut -- Abutment: Backwall -- Rated 4, Was 4
Beg Abut -- Wingwalls: Walls -- Rated 4, Was 4
End Abut -- Abutment: Backwall -- Rated 4, Was 4
End Abut -- Wingwalls: Walls -- Rated 4, Was 4
Referenced Photos: "9", "8", "2", "5", "4"
2012 - At both stems the top corners of the backwall and adjacent portion of the wingwalls are cracked and spalled. The spalling is up to 10" deep and to mid height of backwall.

Note ID: 321210936820002

Approaches: Embankment -- Rated 3, Was 3
Approaches: Erosion -- Rated 3, Was 3
Referenced Photos: "7"
2012 - The begin right embankment has a large erosion gully approx. 10' wide by up to 4' deep. It is approx. 8' back from the rail, but could quickly be a problem with a large storm runoff. A maintenance report was done for this problem 2010.

Note ID: 321210936820003

Approaches: Pavement -- Rated 5, Was 5
Referenced Photos: "6"
2012: Minor cracking along bridge joints allows for '5' rating at this time.

Note ID: 321210936820004

Span 001 -- Superstructure: Paint -- Rated 2, Was 2
Span 002 -- Superstructure: Paint -- Rated 2, Was 2
Referenced Photos: "1"
2012 - The paint system has extensively failed along lower flanges and has failed along the lower 3/4's of the webs, with the remaining paint appearing chalky. Paint system has 40% to 50% loss. The steel primary members are now starting to have rust flakes with section loss approx. less than 5%. This being downrated to a 2 for both spans. Strongly recommend that this structure be painted.

Note ID: 321210936820006

Span 001 -- Pier: Bearings, Bolts, Pads -- Rated 4, Was 4
Referenced Photos: "10", "11"
2012 - The fixed bearings at the pier were not replaced with the begin and end bearing project. They are severely corroded at this time. Two bolts are sheared; bearing #2, span #2, right side and bearing #5, span #1, left side.

Note ID: 321210936820005

Span 002 -- Superstructure: Structural Deck -- Rated 4, Was 6
Referenced Photos: "12", "13", "14", "15"
2012: Deck haunch has cracked across width of bridge at top of haunch

Inspection Notes

Carried: 481I 481I33012088 Crossed: 90I X CheckValue: 1,810,645,070

Note ID: 321210936820005 - continued

resulting in front portions of haunch being dislodged from deck and shifting along top of backwall. Portions behind the first two pedestals have dropped or are about to drop away.

Note ID: 321210936820001

End Abut -- Abutment: Stem (Breastwall) -- Rated 4, Was 4
Referenced Photos: "3"
2012 - The top corners of the seat/stem are cracked horizontally and hollow sounding up to 8" down and back from the corner across the seat. These areas are between peds 1&2, 3&4, 4&5. Between peds 3&4 there is a vertical crack that is spalled and hollow for the full height approx. 1' wide. Other areas of the stem have a few hairline cracks.

Inspection Date: 10/18/2012 RC: 33 BIN: 1093682

NO Overload Vehicles were observed on this bridge

FEDERAL RATINGS:

NBI Deck Condition: 5
NBI Superstruct Condition: 6
NBI Substruct Condition: 5
NBI Channel Condition: N
NBI Culvert Condition: N

Diving Inspection Needs:

Diving Inspection Required? No Date of Last Diving Inspection: No Date

Inventory Problems:

Inventory Problems Exist? No

Miscellaneous:

Time Required to Inspect Bridge: 4 Hours

Lane Closure Needs: None Required

No Railroad Flagging Required

No Pedestrian Fence

There is a Snow Fence present

The BIN Plate is in OK condition

Inspection Date: 10/18/2012 RC: 33 BIN: 1093682

Gen. Rec., Postings, Federal Ratings, etc.

Carried: 481I 481I33012088 Crossed: 90I X CheckValue: 1,810,645,070

Special Emphasis Inspection Required:

Non-Redundant/Fracture Critical Members - No
Pin and Hangers - No
Fatigue-Prone Welds - No
Non-Categorized Fatigue-Prone Details - No
Other (Specified in Text) - No

Special Emphasis Details:

No Special Emphasis Inspection Required.

General Notes To the Next Inspector:

10/18/2012 Bucket truck without lane closure used.

Improvements Observed:

Inspection Date: 10/18/2012 RC: 33 BIN: 1093682

Note:
-If connection ratings govern, record them under stringer ratings for stringer – floorbeam connection, floorbeam ratings for floorbeam-main member connections, etc.
-When Level 1 results indicated the need for load posting or other corrective action, the NYSDOT Regional Structures Engineer shall be notified immediately.
-Load ratings should be filed in the regional office within 60 days of completion of calculations.
-Bridges shall be flagged based on Level I results in accordance with the current NYSDOT flagging procedure.
-Bridge load posting, closure, etc. determinations shall be made as results are being produced.

TECHNICAL MEMORANDUM

FROM: Kian Siang Chau, P.E
NYSPE 082744

DATE: MARCH 20, 2014

RE: SEISMIC SCREENING SUMMARY
NEW YORK STATE DEPARTMENT OF TRANSPORTATION
D031085; PIN 3501.60; I-81

BIN: 1093682 (I-481 NB/I - 90)

This memorandum summarizes the seismic screening conducted for BIN 1093682 as part of the Interstate 81 Project in Syracuse, NY. The purpose of the screening is to determine if seismic retrofits are warranted at the superstructure to substructure connection, and if further seismic evaluation of the structure is required. This memorandum will give the screening results, retrofits required and recommendations for further seismic evaluation of the structure.

SCREENING PROCEDURE

The seismic screening was performed in accordance with the FHWA Seismic Retrofitting Manual for Highway Structures: Part 1 - Bridges, January 2006. As per the referenced manual, seismic screenings were performed for both lower level and upper level earthquake ground motion. The lower level earthquake ground motion has a reasonable likelihood of occurrence within the life of the bridge (50% probability of exceedance within a 75 year bridge life). The upper level earthquake ground motion has a finite likelihood of occurrence within the life of the bridge (7% probability of exceedance within a 75 year bridge life).

Values for the spectral acceleration for the Syracuse area used in the screening are as follows:

- Lower Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.0251$
- Lower Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.0076$
- Upper Level Earthquake Ground Motion for a Short Period (0.2 seconds): $S_S = 0.139$
- Upper Level Earthquake Ground Motion for a Long Period (1.0 seconds): $S_1 = 0.047$

These values are considered constant and are the same for all seismic screenings of bridges in the Syracuse area.

The Site Class is based on the soil conditions at the bridge location. It was determined that this parameter has little effect on the results of the seismic screening because the spectral acceleration values for the Syracuse area are small. Based on this, a site class of D was used for all seismic screenings of bridges in the Syracuse area.

Bridge parameters used in the seismic screening were retrieved from the record drawings and WinBolts data.

The seismic screening takes into account the anticipated service life, importance, and the seismic exposure of the bridge to determine a seismic retrofit category (SRC). The SRC is then used to determine seismic evaluation methods and retrofit measures. There are four SRCs, A through D. Seismic retrofit category A is the lowest category; bridges in this category do not require retrofits or further seismic evaluation. Seismic retrofit category D is the highest category; bridges in this category requiring the most rigorous seismic evaluations and retrofits.

SCREENING RESULTS

The SRC for the bridge is "**C**" for lower level earthquake ground motion and "**B**" for upper level earthquake ground motion.

RETROFITS REQUIRED

Seat width improvements are required at pier. Additional retrofits may be required if further seismic evaluation is needed.

RECOMMENDATIONS FOR FURTHER SEISMIC EVALUATION

No further seismic evaluation is required for lower level earthquake ground motion. For the upper level earthquake ground motion, it is recommended that the capacities of the bearings are checked as per Section 5.2 of the referenced manual.

Retrofit cost estimates will be provided after any further required seismic evaluations are completed.

BRIDGE DECK EVALUATION REPORT

RECOMMENDATIONS

The bridge deck inspection findings and evaluation are used as a tool for developing the scope of work and cost estimates for the development and comparison of alternatives for the overall project.

The total damaged area of the deck is 0% of the total deck surface area. The cores indicate the reinforcement steel is 3.75 inches to 4.75 inches below the surface of the deck. The lab test indicates that chloride ion concentrations at all the sample locations are significantly higher than the corrosion threshold for steel.

Due to the age, condition and high chloride ion content of the bridge deck concrete, the bridge deck should be rehabilitated or replaced to meet the current standards and to mitigate excessive future maintenance costs.

ALTERNATIVES

- Rehabilitation Alternative - 2 inches Bonded Concrete Overlay
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The top 2 inches of the entire deck will be removed and areas of deteriorated concrete must be removed to at least 1 inch below the level of the reinforcement steel and to the horizontal and vertical limit of any detectable hollow areas. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. The proposed deck overlay will be a 2 inches thick bonded concrete overlay yielding a nominal 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.

- Useful Life Expectancy

  The removal of the top 2 inches of the existing deck will remove a portion of the deck with high chloride ion concentrations. It can be anticipated that chloride ions will continue to migrate into the remaining deck to the reinforcing steel resulting in further corrosion-related deterioration of the deck surface. Concrete admixtures will be included in the bonded concrete overlay to impede the continued penetration of chloride into the deck from the surface. This alternative will result in an extended useful life expectancy estimated at 20 years.

The design life of the project is 30 years (ETC + 30). This alternative does not meet the project objectives of obtaining 30 years of service life and is not evaluated further.

- Rehabilitation Alternative – 100% Deep Removal and Partial Deck Reconstruction
  - Scope

    The scope of this alternative will include the complete removal of the bridge railings, curb and safety walks, and fascias to the level of the original top of the deck. The joint will be removed. The scope of this alternative will include partial depth reconstruction with removal of the concrete to at least 1 inch below the top mat of the reinforcement steel. Additionally, any further areas of deteriorated concrete detected will require full depth removal. Any corrosion of the reinforcement steel will be removed by sandblasting or hydro-blasting. Due to the condition of the deck, full depth removal is not likely and not included in the cost estimate. The proposed deck partial reconstruction will be a nominal 5.75 inches thick concrete deck yielding a 9.5 inches standard thickness deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 35 years.
  - Cost Estimate

    The estimated cost for this alternative is $663,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Cast-In-Place Concrete
  - Scope

    This scope of this alternative will include the complete demolition of the existing bridge deck, bridge railings, curb and safety walks, fascias and bridge joint. The bridge deck will be replaced with a new 9.5 inches standard thickness concrete deck. A new single-sloped concrete barrier and a new armorless joint will be installed. The Level 1 Load Rating for the final condition was found to be acceptable.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The estimated cost for this alternative is $925,000. The Engineer's Opinion of Probable Construction Cost worksheet is at the end of this section.

- Replacement Alternative – Pre-cast Concrete Deck Panels
  - Scope

    The scope of this alternative is similar to the Cast-In-Place Concrete Deck Replacement Alternative except the deck structure will be precast panels. This alternative offers reduced construction time over conventional construction.
  - Useful Life Expectancy

    This alternative will provide a useful life expectancy is estimated at 40+ years.
  - Cost Estimate

    The comparison of accelerated construction to conventional construction is beyond the current scope of this evaluation.
